PART II – IMPLEMENTATION PLAN		49
4.	Policy statement	Error! Bookmark not defined.
5.	Implementation of the basic obligations of the Stockholm Convention	49
5.1.	Elimination of intentional production and use of POPs (Article 3(1))	49
5.1.1.	POP pesticides, HCB, HBB and PeCB	49
5.1.2.	PCBs	49
5.1.3.	Hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether	50
5.1.4.	DDT	53
5.1.5.	Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride (PFOS)	53
5.2.	Elimination of import and export of POPs (Article 3(2))	57
5.3.	Prevention of the production and use of new chemicals exhibiting characteristics of POPs (Article 3(3))	57
5.4.	Assessing and controlling chemicals in use (Article 3(4))	58
5.5.	General exemptions	59
5.6.	Reduction of total releases from unintentional production (Article 5)	59
5.7.	Identification and environmentally sound management of stockpiles and wastes	62
5.7.1.	Disposal and destruction of PBDE containing materials	64
5.7.2.	Disposal and destruction of PFOS and PFOS precursor containing materials	66
5.7.3.	Disposal and destruction of POPs Pesticides	67
5.7.4.	Destruction of PCB and PCB containing materials	67
5.8.	Identification of contaminated sites (Annex A, B and C Chemicals) and if addressed then remediation in an environmentally sound manner	67
6.	Implementation of the obligations on supporting activities	68
6.1.	Information exchange	68
6.2.	Public information, awareness and education	69
6.3.	Research, development and monitoring	70
7.	Implementation of other commitments	72
7.1.	Technical assistance	72

7.2.	Financial Assistance	72
7.3.	Reporting	73
7.4.	Effectiveness evaluation	74
7.5.	Addition of Future Chemicals to the Stockholm Convention	75
8.	EU research projects since 2007 with references to POP issues	77

PREFACE

This Commission Staff Working Document presents the second European Union Implementation Plan (UIP) on Persistent Organic Pollutants (POPs). The first European Community Implementation Plan (CIP) was developed in 2007 (SEC (2007) 341)¹. The review and update of the first Implementation Plan has become necessary to address; 1) the inclusion of a number of new POPs into the Stockholm Convention and the UNECE CLRTAP POP Protocol²; 2) the technical and legislative progress made in the area as well as; 3) the findings of the Commission Report COM (2010) 514 on the application of the Regulation (EC) 850/2004 on persistent organic pollutants (POP Regulation).

This document was subject to an open consultation with Member States' competent authorities, industry, environmental organisations and the general public. The contributions submitted by the stakeholders were considered for inclusion in the final version of the second UIP.

The final second UIP on POPs will be submitted to the Secretariat of the Stockholm Convention, of which the European Union is a party.

² UNECE (United Nations Economic Commission for Europe) Protocol to the 1979 Convention on Long-Range Transboundary Air Pollution on Persistent Organic Pollutants

INTRODUCTION

1.1. Persistent Organic Pollutants (POPs)

POPs are chemical substances that persist in the environment, bio-accumulate, and pose a risk of causing significant adverse effects to human health or the environment. These pollutants are transported across international boundaries far from their sources and even accumulate in regions where they have never been used or produced. POPs pose a threat to the environment and to human health all over the globe, with the Arctic, Baltic and the Alpine regions being examples of EU sinks of POPs. International action has been deemed necessary to reduce and eliminate production, use and releases of these substances. The substances addressed in the international legal instruments on POPs are listed in Table 1.

1.2. International agreements addressing POPs

1.2.1. UNECE Protocol on POPs³

The Executive Body to the UNECE Convention on Long-Range Trans-boundary Air Pollution (CLRTAP) adopted the UNECE Protocol on POPs on 24 June 1998 in Aarhus, Denmark. The UNECE Protocol on POPs focuses currently on a list of 16 substances comprising eleven pesticides, two industrial chemicals and three unintentional by-products. The ultimate objective is to eliminate any discharges, emissions and losses of these POP substances.

The UNECE Protocol on POPs bans the production and use of some products outright (aldrin, chlordane, chlordecone, dieldrin, endrin, hexabromobiphenyl, mirex and toxaphene). Others are scheduled for elimination at a later stage (dichloro-diphenyl-trichloroethane (DDT), heptachlor, hexachlorobenzene (HCB) and polychlorinated biphenyls (PCBs)). In addition, the UNECE Protocol on POPs severely also restricts the use of hexachlorocyclohexane (HCH) (including lindane). The Protocol also includes provisions for dealing with the wastes of products that will be banned and it obliges Parties to reduce their emissions of dioxins, furans, polycyclic aromatic hydrocarbons (PAHs) and HCB below their levels in 1990 (or an alternative year between 1985 and 1995). For the incineration of municipal, hazardous and medical waste, it lays down specific emission limit values.

On 18 December 2009, Parties to the Protocol on POPs adopted decisions 2009/1, 2009/2 and 2009/3 to amend the Protocol to include seven new substances: hexachlorobutadiene, octabromodiphenyl ether, pentachlorobenzene, pentabromodiphenyl ether, perfluorooctane sulfonic acid (PFOS), its salts and other derivatives, polychlorinated naphthalenes and short-chain chlorinated paraffins. Furthermore, the Parties revised obligations for DDT, heptachlor, HCB and PCBs as well as certain emission limit values (ELVs) from waste incineration, sinter plants and electric arc furnaces for secondary steel production. Parallel to this, with a view to facilitating the Protocol's ratification by countries with economies in transition, the Parties introduced flexibility for these countries regarding the time frames for the application of ELVs and best available technologies (BAT). Finally, the Parties adopted decision 2009/4 to update guidance on BAT to control emissions of POPs in annex V and turn parts of it into

³ http://www.unece.org/env/lrtap/pops_h1.htm

a guidance document (ECE/EB.AIR/2009/14⁴). These amendments have not yet entered into force.

1.2.2. *Stockholm Convention*⁵

The Stockholm Convention on POPs was adopted in 2001 and entered into force in 2004. It promotes global action on an initial cluster of twelve POP substances, with an overall objective to protect human health and the environment from POPs and requires Parties to take measures to eliminate or reduce the release of POPs into the environment. Specific reference is made to a precautionary approach as set forth in Principle 15 of the 1992 Rio Declaration on Environment and Development. This principle is implemented by Article 8 of the Convention, which lays down the rules for including additional chemicals in the Stockholm Convention.

The Annexes A, B and C to the Convention were amended in 2009 to include nine new POPs. The amendments entered into force on 26 August 2010 and add the following chemicals to Annexes A, B and/or C of the Convention: alpha hexachlorocyclohexane; beta hexachlorocyclohexane; chlordecone; hexabromobiphenyl; hexabromodiphenyl ether and heptabromodiphenyl ether (commercial octabromodiphenyl ether); lindane; pentachlorobenzene; PFOS, its salts and perfluorooctane sulfonyl fluoride (PFOSF); and tetrabromodiphenyl ether and pentabromodiphenyl ether (commercial pentabromodiphenyl ether).

The Annex A to the Convention was further amended in 2011 to include the pesticide endosulfan, making a total of 22 substances regulated under the Convention. This amendment entered into force on 27 October 2012.

The 18 chemicals currently listed in Annex A of the Stockholm Convention are subject to a prohibition on production and use, except where there are generic or specific exemptions. In addition, the production and use of DDT, a pesticide still used in many developing countries, is severely restricted, as set out in Annex B of the Stockholm Convention. This is also the case for PFOS, its salts and PFOSF that have been added as part of the 2009 amendments.

The generic exemptions allow laboratory-scale research, use as a reference standard and unintentional trace contaminants in products and articles. Articles containing POPs manufactured or already in use before the date of entry into force of the relevant obligation are also subject to an exemption provided that Parties submit information on the uses and a national plan for waste management for such articles to the Secretariat of the Stockholm Convention.

Releases of unintentionally produced by-products listed in Annex C (dioxins, furans, PCBs, PeCB and HCB) are subject to continuous minimisation with the ultimate objective of total elimination, where feasible. According to Annex C, Parties shall promote and, in accordance with their action plans, require the use of best available techniques for new sources within their major source categories identified in Part II and Part III of Annex C of the Stockholm Convention.

The Stockholm Convention also foresees identification and safe management of stockpiles containing or consisting of POPs. Waste containing, consisting of or contaminated with POPs should be disposed of in such a way that the POP content is destroyed or irreversibly transformed so that it does not exhibit POPs characteristics. Where this does not represent the

⁴ <http://www.unece.org/env/documents/2009/EB/eb/POPs/Guidance%20document%20on%20BAT.e.pdf>

⁵ <http://chm.pops.int/Convention/ConventionText/tabid/2232/language/en-GB/Default.aspx>

environmentally preferable option or where the POP content is low, waste shall be otherwise disposed of in an environmentally sound manner. Disposal operations that may lead to recovery or re-use of POPs are explicitly forbidden. With regard to shipment of wastes, relevant international rules, standards and guidelines, such as the 1989 Basel Convention on the Control of Trans-boundary Movements of Hazardous Wastes and their Disposal, are to be taken into account.

In addition to control measures, the Stockholm Convention includes several general obligations. Each Party is obliged to develop and endeavour to implement a National Implementation Plan, facilitate or undertake the exchange of information and promote and facilitate awareness and public access to information on POPs. The Parties shall also encourage or undertake appropriate research, development, monitoring and co-operation pertaining to POPs, and where relevant, to their alternatives and to candidate POPs. They shall also regularly report to the Conference of the Parties on the measures taken to implement the provisions of the Stockholm Convention.

The Stockholm Convention recognises the particular needs of developing countries and countries with economies in transition and therefore specific provisions on technical assistance and on financial resources and mechanisms are included in the general obligations.

(1) Table 1 Overview on POPs regulated at international level; the new POPs under the Stockholm Convention are highlighted in grey

Substance	CAS	Listed in Stockholm Convention	Listed in the UNECE Protocol on POPs	EU POP regulation
Intentionally produced POPs				
Aldrin	309-00-2	Annex A	yes	Aldrin
Chlordane	57-74-9	Annex A	yes	Chlordane
Chlordecone	143-50-0	Annex A	yes	Chlordecone
Dieldrin	60-57-1	Annex A	yes	Dieldrin
Endosulfan	959-98-8 33213-65-9 115-29-7 1031-07-8	Annex A	-	-
Endrin	72-20-8	Annex A	yes	Endrin
Heptachlor	76-44-8	Annex A	yes	Heptachlor
Hexabromobiphenyl (HBB)	36355-01-8	Annex A	yes	Hexabromobiphenyl
Hexabromodiphenyl ether and heptabromodiphenyl ether	68631-49-2 207122-15-4 446255-22-7 207122-16-5 and others	Annex A	yes	Hexabromodiphenyl ether Heptabromodiphenyl ether
Hexachlorobenzene (HCB)	118-74-1	Annex A	yes	Hexachlorobenzene
Alpha hexachlorocyclohexane*	319-84-6	Annex A	yes: Hexachlorocyclohexanes (HCH; CAS: 608-73-1 ⁶), including lindane (CAS: 58-89-9)	Hexachlorocyclohexanes, including lindane
Beta hexachlorocyclohexane*	319-85-7	Annex A		
Lindane*	58-89-9	Annex A		
Mirex	2385-85-5	Annex A	yes	Mirex
Pentachlorobenzene	608-93-5	Annex A	yes	Pentachlorobenzene

⁶ This CAS No. covers the isomer mixture of alpha, beta, gamma, delta and epsilon HCH.

Substance	CAS	Listed in Stockholm Convention	Listed in the UNECE Protocol on POPs	EU POP regulation
Polychlorinated biphenyls (PCB)	all PCBs and their mixtures have different CAS numbers	Annex A	yes	Polychlorinated Biphenyls (PCB)
Tetrabromodiphenyl ether and pentabromodiphenyl ether	5436-43-1 60348-60-9 and others	Annex A	yes	Tetrabromodiphenyl ether
				Pentabromodiphenyl ether
Toxaphene	8001-35-2	Annex A	yes	Toxaphene
DDT	50-29-3	Annex B	yes	DDT (1,1,1-trichloro-2,2-bis(4-chlorophenyl)ethane)
Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride (PFOS)	1763-23-1 s, 307-35-7, and others	Annex B	yes	Perfluorooctane sulfonic acid and its derivatives (PFOS)
SCCPs – short chain chlorinated paraffins	85535-84-8	under review	yes	-
HCBD – hexachlorobutadien	87-68-3	under review	yes	-
PCN – polychlorinated naphthalenes	all PCNs & their mixtures have different CAS numbers	under review	yes	-
Unintentionally produced POPs				
Polychlorinated dibenzop-dioxins (PCDD)	1746-01-6	Annex C	yes	Polychlorinated dibenzop-dioxins and dibenzofurans (PCDD/PCDF)
Polychlorinated dibenzofurans (PCDF)	1746-01-6	Annex C	yes	
Hexachlorobenzene (HCB)	118-74-1	Annex C	yes	Hexachlorobenzene (HCB)
Pentachlorobenzene	608-93-5	Annex C	yes	Pentachlorobenzene
Polychlorinated Biphenyls (PCBs)	all PCBs & their mixtures have different CAS numbers	Annex C	yes	Polychlorinated biphenyls (PCB)
Polycyclic aromatic hydrocarbons (PAHs)	207-08-9 and others	no	yes	Polycyclic aromatic hydrocarbons

* Lindane, Alpha- and Beta hexachlorocyclohexane, as well as Chlordecone and Hexabromobiphenyl are new POPs under the Stockholm Convention but have already been covered under the POP Protocol and the EU POP regulation.

1.2.3. Coordination and cooperation among the Basel, Rotterdam and Stockholm Conventions

The Basel, Rotterdam and Stockholm Conventions are multilateral environmental agreements, which share the common objective of protecting human health and the environment from hazardous chemicals and wastes. These agreements can assist countries to manage chemicals at different stages of their life-cycle.

Recognizing the potential for synergistic work under the three conventions at the national, regional and global levels, the international community has worked over the past years on enhancing cooperation and coordination among the Basel, Rotterdam and Stockholm Convention. These efforts culminated in the adoption of recommendations on enhancing cooperation and coordination among the three conventions by the three Conferences of the Parties held in 2008 and 2009, and the holding of simultaneous extraordinary meetings of the

Conferences of the Parties to the Basel, Rotterdam and Stockholm Conventions in Bali, Indonesia in February 2010.

The first outcome of this process is the appointment of a single executive secretary for the three conventions; restructuring of the secretariats in a manner that strengthens organizational synergies while respecting the legal autonomy of each convention.

1.3. Purpose of the Union Implementation Plan (UIP) on POPs

The Stockholm Convention lays down an obligation to all Parties, to develop and endeavour to implement a plan for the implementation of its obligations under the Stockholm Convention. For the Union, this obligation is also transferred to the Article 8 of Regulation (EC) No 850/2004 on Persistent Organic Pollutants. The Union has in 2007 therefore developed an Implementation Plan on POPs, which also covers the substances that fall under the UNECE Protocol on POPs⁷.

The overall purpose of the UIP is not only to fulfill legal obligations, but also to take stock of actions taken and lay down a strategy and action plan for further Union measures related to POPs included in the Stockholm Convention and/or in the UNECE Protocol on POPs.

The UIP therefore aims to:

- review the existing Union level measures related to POPs;
- assess their efficiency and sufficiency in meeting the obligations of the Stockholm Convention;
- identify needs for further Union level measures;
- establish a plan for implementing the further measures;
- identify and strengthen links and potential synergies between POPs management and other environmental policies and other policy fields; and
- increase awareness on POPs and their control measures.

⁷ SEC (2007) 341

PART I – PARTY BASELINE

This section presents the Union’s baseline with regard to POP substances regulated under the Stockholm Convention and the POP Protocol. As such it includes at first an overview on the key EU legislation related to the implementation of obligations in the mentioned international frameworks as well as related EU strategies and programmes, followed by a description of existing financial instruments to support the implementation as well as research activities. In order to get a full picture of the status quo of the implementation, a description will be provided on what efforts are currently being undertaken by the Union to raise awareness and enhance communication. Furthermore, an overall assessment of POPs regarding their production, their use, their placing on the market as well as with regard to existing stockpiles and the contamination of the waste stream will be described.

This Part I ‘Party Baseline’ presents the basic information on the EU situation and will be followed by an in-depth analysis in Part II regarding each single obligation of the Stockholm Convention. This analysis is followed by the identification of actions to improve the implementation.

2. KEY UNION LEGISLATION AND POLICIES RELATED TO EU’S OBLIGATIONS UNDER THE STOCKHOLM CONVENTION AND UNECE POP PROTOCOL

The EU has implemented a number of legislative measures that are related to POPs. The following figure gives an overview of the main chemical and environmental legislation relating to POPs and to which stage of the lifecycle it refers to. Details on the legislation related to POPs are described in the following sub-sections.

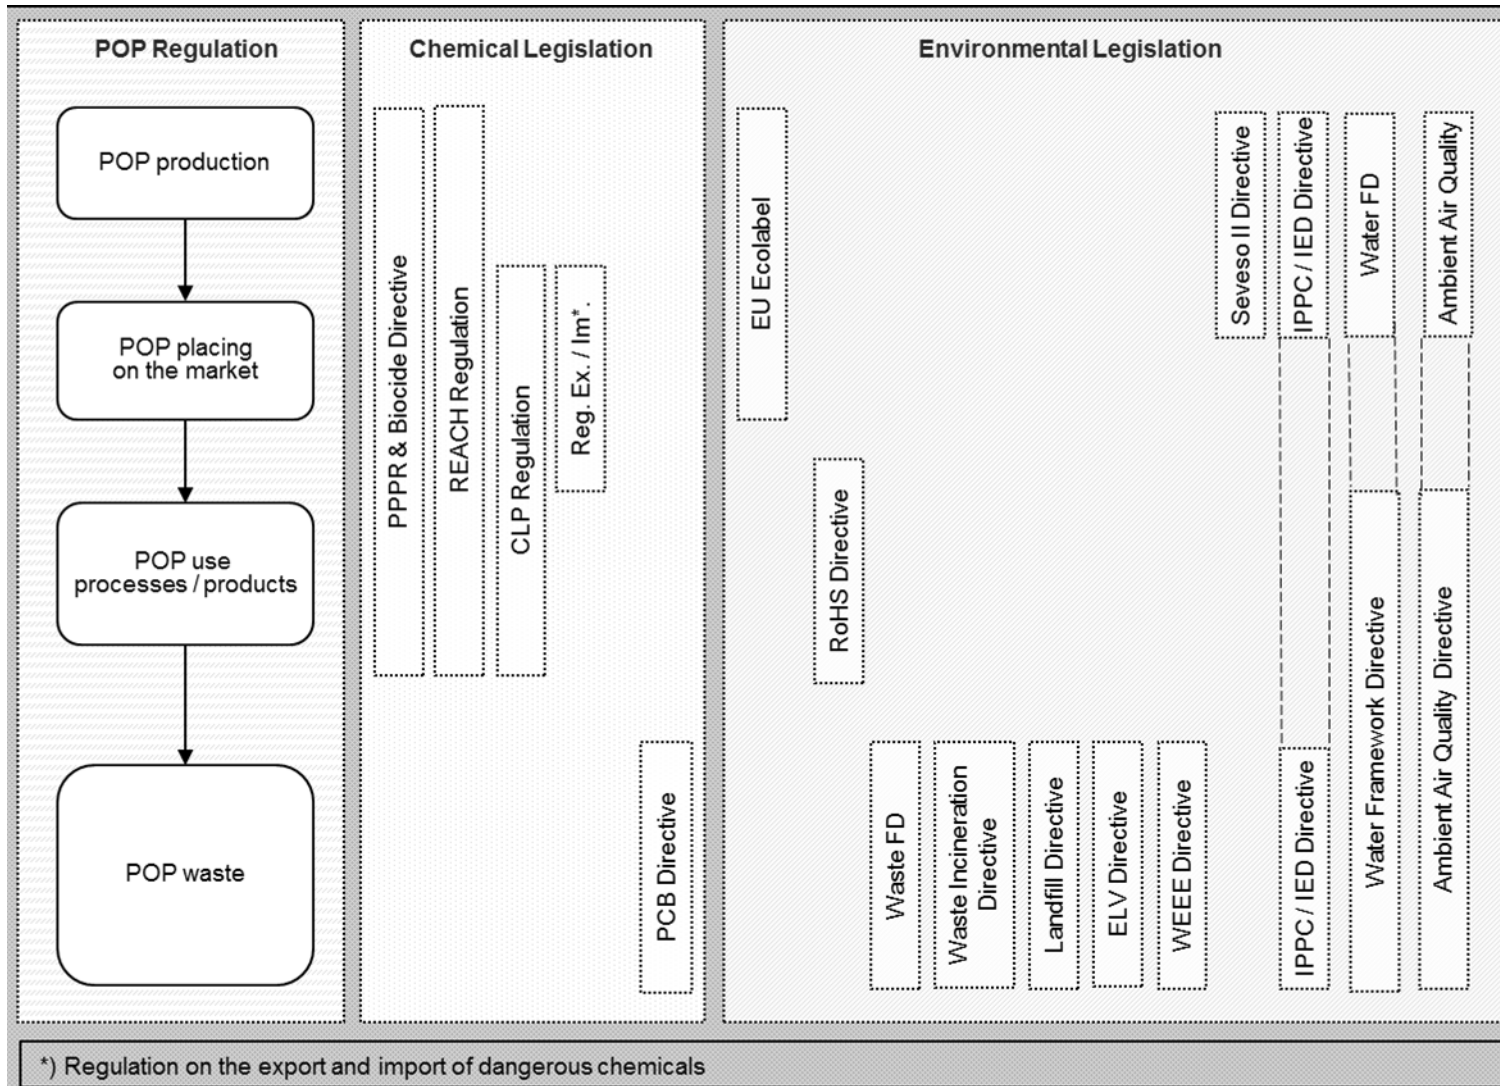

Figure 1: Overview on the main chemical and environmental legislation related to POPs

NB Directive 2000/76/EC on the incineration of waste was replaced by Industrial Emissions Directive on 7th of January 2014.

2.1 Legislative instruments

2.1.1 The POP Regulation

The main legal instrument for implementing the Stockholm Convention and the UNECE Protocol on POPs is the **Regulation (EC) No 850/2004** on persistent organic pollutants (POPs) (hereafter called the “POP Regulation”). This Regulation entered into force on 20 May 2004 and as a regulation it is directly applicable in all Member States, including those which are not yet Parties to the Stockholm Convention or the UNECE POP Protocol.

The POP Regulation contains provisions regarding production, placing on the market and use of chemicals, management of stockpiles and wastes and measures to reduce unintentional releases of POPs⁸. General and specific exemptions to these prohibitions are limited to a minimum. Furthermore, the POP Regulation contains provisions requiring the setting up of emission inventories for unintentionally produced POPs, national and European Union implementation plans and monitoring and information exchange mechanisms. To a certain extent the POP Regulation goes further than the international agreements emphasising the aim to eliminate the production and use of the internationally recognised POPs.

The POP regulation has been amended seven times. The concentration limits in Annex IV and V were established by Regulation (EC) No 1195/2006⁹ and 172/2007¹⁰, respectively. Annex V was further amended by Regulation (EC) No 323/2007¹¹ in order to allow pre-treatment operations prior to the permanent storage of wastes containing POPs. Regulation (EC) No 219/2009¹² empowered the Commission to establish some concentration limits in the annexes, to amend annexes whenever a substance is listed in the Convention or the Protocol, to modify the existing entries and to adapt annexes to scientific and technical progress. The decision of the Conference of the Parties to the Basel Convention on the updated general technical guidelines for the environmentally sound management of waste consisting of, containing or contaminated with POPs was taken up by Regulation (EC) No 304/2009 amending Annexes IV and V as regards the treatment of waste containing POPs in thermal and metallurgical production processes¹³. The decisions of the fourth meeting of the Conference of the Parties (COP4) to the Stockholm Convention on 4–8 May 2009 to list new substances were taken up by the Regulation (EU) No 757/2010¹⁴ amending Annexes I and III and by the Regulation (EU) No 756/2010 of 24 August 2010 amending Annexes IV and V¹⁵.

⁸ Exports of POPs are regulated under the Rotterdam Convention with the so-called Prior Informed Consent (PIC) procedure.

¹⁰ OJ L 55, 23.2.2007, p. 1

¹¹ OJ L 85, 27.3.2007, p. 3

¹² <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:087:0109:0154:EN:PDF>

¹³ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:096:0033:0036:EN:PDF>

¹⁴ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2010:223:0029:0036:EN:PDF>

¹⁵ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2010:223:0020:0028:EN:PDF>

The Commission adopted further amendments to Annexes IV and V¹⁶ to set the missing concentration limit values (the so-called lower and upper POP content) for PFOS and PBDEs, as well as amendments to Annexes I, IV and V to take into account the decisions of the fifth meeting of the Conference of the Parties (COP5) to the Stockholm Convention to list Endosulfan and of the 27th Session of the CLRTAP Executive Body to list hexachlorobutadiene (HCB), polychlorinated naphthalenes (PCN) and short chain chlorinated paraffins (SCCP).

Concerning management of stockpiles, the Regulation provides that all remaining stockpiles for which no use is permitted shall be managed as waste. Stockpiles greater than 50 kg meant for permitted uses shall be notified to the competent authority and managed in a safe, efficient and environmentally sound manner. Holder of a stockpile consisting of or containing any POPs for which no use is permitted shall manage that stockpile as waste generally in such a way that the POP content is destroyed or irreversibly transformed.

With regard to wastes, producers and holders of waste are obliged to undertake measures to avoid contamination of waste with POP substances. Waste with POPs content higher than the above mentioned lower POP limits must generally be disposed of or recovered in such a way that the POP content is destroyed or irreversibly transformed. By way of derogation, wastes containing POPs below the limit values indicated in Annex V may be otherwise dealt with in accordance with a method listed in Annex V, part 2, subject to the conditions outlined in Article 7.4 (b).¹⁷.

2.1.2 EU chemical legislation

Other chemical legislation complements the POP Regulation in implementing the obligations of the Stockholm Convention and the POP Protocol. As Table 2 shows, the other chemical legislation particularly ensures that POPs are imported and exported only for allowed uses and in conformity with the prior informed consent procedure under the Rotterdam Convention, ensures that POPs are collected and irreversibly destroyed and prevents that the chemicals exhibiting POP characteristics are produced or marketed.

Table 2 EU chemicals legislation relevant for POPs

Acronym	Legal reference	POPs regulated / POP reference	Areas of regulation
REACH	Regulation 1907/2006	Testing on PBT (persistent, bioaccumulative and toxic) criteria according to Annex XIII	Production, placing on the market & use
CLP	Regulation 1272/2008	Inventory of classification and labelling of hazardous substances.	Classification, Labelling, Packaging
Plant Protection Product Regulation	Regulation (EC) No 1107/2009	Active substance, safener or synergist shall only be approved where it is not considered to be a persistent organic pollutant (POP) resp. PBT substance.	Placing on the market & use

¹⁶ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2012:159:0001:0004:en:PDF>

¹⁷ The upper concentration limits are not valid for permanent underground landfilling. Regulation 172/2007 amending Regulation 850/2004: „These limits exclusively apply to a landfill site for hazardous waste and do not apply to permanent underground storage facilities for hazardous wastes, including salt mines.”

Acronym	Legal reference	POPs regulated / POP reference	Areas of regulation
		Active substances meeting two of the PBT criteria shall be candidates for substitution	
Biocidal Products Regulation	Regulation (EC) 528/2012	Active substances meeting two of the PBT criteria shall be candidates for substitution	Placing on the market & use
Export and import of dangerous chemicals	Regulation 689/2008, repealed with effect from 1 March 2014 by Regulation 649/2012	POPs as listed in Annexes A and B of the Stockholm Convention are subject to export ban	Export and import of dangerous chemicals
PCB Directive	Directive 96/59/EC	Disposal of polychlorinated biphenyls and polychlorinated terphenyls (PCB/PCT)	Disposal

2.1.2.1 REACH

Regulation (EC) No 1907/2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) inter alia provides provisions to ensure that industrial chemicals having POP characteristics are identified and prevented from being produced or imported in the EU.

REACH requires EU companies which manufacture or import chemical substances in quantities of one tonne or more per year to register these substances and ensure that they can be used safely. This information is submitted in the form of registration dossiers to the European Chemicals Agency (ECHA)¹⁸. The submission contains a technical dossier and, for substances manufactured or imported in quantities of 10 tonnes per annum (tonnes p.a.) or above, a Chemical Safety Report. The chemical safety assessment has to cover:

- (a) human health hazard assessment;
- (b) physicochemical hazard assessment;
- (c) environmental hazard assessment;
- (d) persistent, bioaccumulative and toxic (PBT) and very persistent and very bioaccumulative (vPvB) assessment.

For hazardous substances (such as those assessed to be a PBT or vPvB), an exposure assessment and risk characterisation must be included in the Chemical Safety Report. For some of the substances identified as PBT or vPvB, an authorisation from the Commission is required for particular uses. This is the case when a substance meeting the substances of very high concern (SVHC) criteria¹⁹ is included in Annex XIV of the Regulation and will then become banned once the set sunset date has passed unless an authorization is granted. Only specific uses for which a request for authorization has been made following specific requirements with regard to the assessment of the substance can be allowed. Prior to inclusion into Annex XIV the selected substances are part of the so-called Candidate List which in itself already implies a number of obligations such as e.g. the obligation to deliver information on the content of a substance in an article.

¹⁸ <http://echa.europa.eu/>

¹⁹ <http://echa.europa.eu/addressing-chemicals-of-concern/authorisation/substances-of-very-high-concern-identification>

REACH further includes the possibility to restrict the use, placing on the market or production of substances by listing them in Annex XVII of REACH. This is another legal instrument that can be used to prevent production and use of substances having POP characteristics.

With the above described measures REACH gives greater responsibility to industry to manage the risks from chemicals and to provide safety information on the substances. This information has to be passed down the chain of production. The REACH Regulation also aims to increase the knowledge of the chemicals properties and of the exposure through the required provision of specific documentation and to improve the risk management of chemicals.

2.1.2.2. CLP

The CLP Regulation (EC) No. 1272/2008 is the European Regulation²⁰ on Classification, Labelling and Packaging of chemical substances and mixtures. The legislation introduces throughout the EU a system for classifying and labelling chemicals, based on the United Nations' Globally Harmonised System (UN GHS). CLP is about the hazards of chemical substances and mixtures and how to inform others about them. The CLP does not contain a specific hazard class for PBT and vPvB substances, however article 53(2) call for the promotion at the UN level for the harmonisation of the criteria for classification and labelling of PBT and vPvB substances. However, the classification and labelling inventory²¹ set up by the CLP Regulation make available relevant information that can be used to identify new potential POP candidates and also provides classification and labelling on several POPs.

2.1.2.3. Regulation on Plant Protection Products

Regulation (EC) No 1107/2009²² concerning the placing of plant protection products on the market (PPP Regulation) prevents chemicals exhibiting POP characteristics from being used in plant protection products. This is achieved by the provisions according to which an active substance, safener or synergist shall only be approved for use in plant protection products where it is not considered to be a POP or if it is not considered to be a persistent, bioaccumulative and toxic (PBT) substance or a very persistent and very bioaccumulative substance (vPvB). In addition, a substance shall be approved as a candidate for substitution if it meets two of the PBT criteria.

2.1.2.4. Biocides Products Regulation

The previous legislation, Directive 98/8/EC on biocidal products, did not contain specific provisions for POP nor for PBT/vPvB substances. However, on 12 June 2009, the European Commission adopted a proposal for a Regulation concerning the placing on the market and

²⁰ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2008:353:0001:1355:en:PDF>

²¹ <http://echa.europa.eu/en/information-on-chemicals/cl-inventory>

²² <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:309:0001:0050:EN:PDF>

use of biocidal products (COM (2009) 267²³) to replace Directive 98/8/EC. The regulation (EU) 528/2012 entered into force on 1 January 2013.

The regulation aims to promote substitution of substances exhibiting POP or PBT characteristics in biocidal products for less hazardous ones and allows the use of POP or PBT substances in biocidal products only if there are no alternatives available. This is achieved by the provision that an active substance that meets two of the PBT criteria as set out in Annex XIII of the REACH Regulation shall be considered a candidate for substitution and shall be identified as such in Annex I of the new Biocide Regulation. The inclusion of an active substance in Annex I that is considered as a candidate for substitution shall be renewed for a period not exceeding ten years. As part of the evaluation of an application for an authorisation (or a renewal of an authorisation) of a biocidal product containing an active substance that is a candidate for substitution, the Competent authority shall perform a comparative assessment to evaluate whether there are other authorised biocidal products (or non-chemical control or prevention methods) which present significantly lower risk for human or animal health or the environment.

2.1.2.5. Regulation on the export and import of dangerous chemicals

2.1.2.6. The export of POP substances or articles containing POPs is regulated by Regulation (EU) No 649/2012 concerning the export and import of hazardous chemicals. This Regulation implements the Rotterdam Convention on the Prior Informed Consent (PIC) Procedure for Certain Hazardous Chemicals and pesticides in International Trade and provides for an export ban of POP substances listed in Annex A and B of the Stockholm Convention and in Regulation (EC) No 850/2004. The decisions of the fourth meeting of the Conference of the Parties (COP4) to the Stockholm Convention held on 4–8 May 2009 to list new substances were implemented by Regulation (EU) No 214/2011 and currently the export of all substances listed in Annexes A and B of the Stockholm Convention except PFOS is banned. The fifth Conference of the Parties to the Stockholm Convention (April 2011) decided to list endosulfan in Annex A. That decision was implemented in the European Union by Regulation (EU) No 73/2013, which adds endosulfan to the list of chemicals that are banned for export. The export of PFOS is currently still possible, but only on condition that the importing country consents to the import of that chemical. PCB Directive (Directive 96/59/EC)

Articles containing PCBs already in use are covered by specific provisions laid down in Directive 96/59/EC. The directive aims for the approximation of the laws of the Member States on the controlled disposal of PCBs, the decontamination or disposal of equipment containing PCBs and/or the disposal of used PCBs in order to eliminate them completely. According to the Directive, Member States had to take the necessary measures to ensure that used PCBs are disposed of and that PCBs and equipment containing PCBs are decontaminated or disposed of in an appropriate manner.

Member States were obliged to compile inventories of equipment with PCB volumes of more than 5 dm³. These inventories were to be sent to the Commission by September 1999 at the

²³

<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2009:0267:FIN:EN:PDF>

latest. The equipment and PCBs contained in the inventories had to be decontaminated or disposed of by 2010 at the latest. The inventories must supply the following data:

- the names and addresses of the holders;
- the location and description of the equipment;
- the quantity of PCBs contained in the equipment;
- the date and type of treatment planned;
- the date of the declaration.

Moreover, the Directive stipulates that any equipment which is subject to inventory must be labelled. Member States must prohibit the separation of PCBs from other substances for the purpose of reusing the PCBs and the topping-up of transformers with PCBs.

Concerning the appropriate waste management, Member States had to take the necessary measures to ensure that:

- PCBs, used PCBs and equipment containing PCBs which is subject to inventory are transferred to licensed undertakings, at the same time ensuring that all necessary precautions are taken to avoid the risk of fire;
- any incineration of PCBs or used PCBs on ships is prohibited;
- all undertakings engaged in the decontamination and/or the disposal of PCBs, used PCBs and/or equipment containing PCBs obtain permits;
- transformers containing more than 0.05% by weight of PCBs are decontaminated under the conditions specified by the Directive.

In accordance with the committee procedure referred to in Directive 75/442/EEC²⁴, the Commission:

- had to fix the reference methods of measurement to determine the PCB content of contaminated materials²⁵;
- could fix technical standards for the other methods of disposing of PCBs;
- had to make available a list of the production names of capacitors, resistors and induction coils containing PCBs²⁶;
- had to determine, if necessary, other less hazardous substitutes for PCBs.

Within three years following the adoption of Directive 96/59/EC, Member States had to draw up plans for the decontamination and/or disposal of inventoried equipment and the PCBs contained therein and plans for the collection and subsequent disposal of equipment not subject to inventory.

2.1.3. Other environmental legislation with POP relevance

In addition to the chemical legislation, environmental legislation especially those targeting water, waste and products also cover POP-related issues. Table 3 summarizes the most relevant legislation with POP relevance and indicates which POPs are regulated. The

²⁴ OJ L 194, 25.7.1975, p. 39.

²⁵ This task has been addressed by Commission Decision 2001/68/EC establishing two reference methods of measurement for PCBs pursuant to Article 10(a) of Council Directive 96/59/EC.

²⁶ In 2001 the Commission has drawn up a list and made it available to the Member States

legislation is presented in more details in Part II if further measures for the implementation may be necessary.

In comparison with the first Implementation Plan, 3 new legislative acts have been adopted: Directive 2008/98/EC on Waste (Waste Framework Directive), Regulation (EC) No 66/2010 on the EU Ecolabel and Directive 2006/11/EC on pollution caused by certain dangerous substances discharged into the aquatic environment.

Table 3 Further environmental legislative instruments with relevance on the use and disposal of POPs.

Acronym	Legal reference	POPs regulated / POP reference	Areas of regulation
EU Ecolabel	Regulation (EC) No 66/2010	Criteria of product categories laid down in Commission decisions may cover POPs e.g. in textile floor covering for trace contamination with POP pesticides ²⁷ A product cannot obtain an ecolabel if it contains a PBT/vPvB substance.	Different product categories, see: ²⁸
RoHS Directive	Directive 2011/65/EU (recast of 2002/95/EC)	Ban of PBDE and other hazardous substances in electrical and electronic equipment.	Production and import of electrical and electronic products
Waste Framework Directive	Directive 2008/98/EC	The classification of waste as hazardous waste should be based, inter alia, on the Union legislation on chemicals, in particular concerning the classification of preparations as hazardous, including concentration limit values used for that purpose. ²⁹	Waste
Waste Incineration Directive	Directive 2000/76/EC, repealed and replaced by IED 2010/75/EU from 7 January 2014	Emission limit values for air, discharges of waste water for dioxins and furans .	Waste
Directive 76/464/EEC has been codified as 2006/11/EC	Directive 2006/11/EC	Pollution through the discharge of the various dangerous substances within List I into the aquatic environment must be eliminated. List I contains certain individual substances selected mainly on the basis of their toxicity, persistence and bioaccumulation.	Pollution caused by certain dangerous substances discharged into the aquatic environment
Landfill Directive	Directive 1999/31/EC	Hazardous waste for landfills needs a prior treatment.	Waste
WEEE Directive	Directive 2002/96/EC, repealed with effect from 15 February 2014 by Directive 2012/19/EU	Provisions on waste containing hazardous substances, e.g. PCB (PCBs/PCTs containing capacitors), mandatory segregation of PCB-containing components.	Treatment of waste of electrical and electronic equipment
ELV Directive	Directive 2000/53/EC	Due to the segregation of hazardous components from the vehicle, the releases of unintentional POPs from shredder plants are decreased.	Collection, treatment, recycling and disposal of end-of-life vehicles.

²⁷ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:332:0001:0016:EN:PDF>
²⁸ http://ec.europa.eu/environment/ecolabel/ecolabelled_products/product_categories_en.htm
²⁹ http://ec.europa.eu/environment/waste/framework/framework_directive.htm

Acronym	Legal reference	POPs regulated / POP reference	Areas of regulation
Water Framework Directive	Directive 2000/60/EC	Persistent hydrocarbons and persistent and bioaccumulable organic toxic substances indicated as main pollutants under Annex VIII. Several POPs included in Annex X (list of Priority Substances (PS), for which Environmental Quality Standards are set and there is a monitoring and reporting obligation; most of the POPs in the PS list are also Priority Hazardous Substances, for which there is an objective to phase out discharges, emissions and losses..	Protection of inland surface waters, transitional waters, coastal waters and groundwater
Drinking Water Directive	Council Directive 98/83/EC	Standards for the most common substances (so-called parameters), among them polycyclic aromatic hydrocarbons, and pesticides (aldrin, dieldrin, heptachlor and heptachlor epoxide).	Quality of water intended for human consumption
Marine Strategy Framework Directive	Directive 2008/56/EC	Synthetic compounds identified as priority substances under directive 2000/60/EC which are relevant for the marine environment.	Protection of marine waters under the sovereignty and jurisdiction of Member States
SEVESO I/II / III Directive	Directive 96/82/EC to be repealed with effect from 1 June 2015 and replaced by Seveso III Directive 2012/18/EU (adopted on 4 July 2012 and entered into force on 13th August 2012)	Pollution from industrial accidents.	Prevention, Preparedness and Response to chemical accidents

2.1.4. Legislation covering unintentional POPs

An overview of legislation covering the releases of unintentionally produced POPs is given in Table 4. The most important is Directive 2010/75/EU on industrial emissions (IED)³⁰ which will replace Directive 2008/1/EC concerning integrated pollution prevention and control (IPPC Directive) and Directive 2000/76/EC on Waste Incineration from 7 January 2014 on.

The IED was adopted on 24 November 2010 and entered into force on 6 January 2011. It had to be transposed into national legislation by Member States by 7 January 2013.

The purpose of the IPPC Directive/IED is to ensure a high level of protection of the environment taken as a whole. Industrial installations operating activities covered by Annex I of the Directives are required to obtain an environmental permit from the authorities in the EU Member States. Emissions of all relevant polluting substances (including POPs), which are likely to be emitted in significant quantities, have to be regulated in the permit. The conditions set out in this permit, in particular the emission limits, have to be based on the application of the Best Available Techniques (BAT). The whole environmental performance of the installation is taken into account, covering e.g. emissions to air, water and land, generation of waste, use of raw materials, energy efficiency, noise, prevention of accidents, and restoration of the site upon closure.

The definition of BAT in the IPPC Directive/IED generally corresponds with the one of the Stockholm Convention. In order to identify BAT, the Commission organised an information exchange, where BAT is described and defined for the different industrial sectors in so-called Best Available Techniques REFerence Documents (BREFs). Where relevant, also for POPs,

³⁰

<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32010L0075:EN:NOT>

BAT Associated Emission Levels (BAT-AELs) are developed. Under the IED, the BAT conclusions and the BAT-AELs set out therein are to be used directly in setting permit conditions and emission limit values for permits.

Table 4 Legislation covering unintentional POPs

Acronym	Legal reference	POPs regulated / POP reference
IPPC / IED	Directive 2008/1/EC (IPPC), merged in Directive 2010/75/EU (IED)	Polychlorinated dibenzodioxins and polychlorinated dibenzofurans among the main air pollutants to be considered in permitting and persistent hydrocarbons and persistent and bioaccumulable organic toxic substances among the main water pollutants. First series of Commission Implementing Decisions establishing BAT conclusions for the different industrial sectors have been adopted under IED (more to follow over the coming years).
Waste Incineration Directive	Directive 2000/76/EC, to be repealed and replaced by IED from 7 January 2014	Emission limit values for air, discharges of waste water for dioxins and furans.
Ambient air quality	Directive 2004/107/EC	Limit values for benzo[a]pyrene as a marker for PAH in ambient air.
Water Framework Directive	Directive 2000/60/EC	PAHs, hexachlorobenzene, hexachlorobutadiene, pentachlorobenzene are included in Annex X as PHS, i.e. Environmental Quality Standards are set and there is an objective to phase out discharges, emissions and losses.
POPs Regulation	Regulation (EC) No 850/2004	measures to reduce unintentional releases of POPs. Set up of emission inventories for unintentionally produced POPs.

2.1.5. Legislation on food and feed and on the protection of public health

Regulations (EC) No 1881/2006 and 396/2005 and Directive 2002/32/EC set maximum residues levels for POP substances in food and feed. Regulation (EC) No 1883/2006 sets minimum requirements on methods of sampling and analysis for the official control of levels of dioxins and dioxin-like PCBs in certain foodstuffs and Regulation (EC) 152/2009 sets minimum requirements on methods of sampling and analysis for the official control of levels of dioxins and dioxin-like PCBs in feed. (see Table 5) In comparison with the situation when the first Implementation Plan was drafted, there are substantial changes in the EU food and feed legislation: These changes relate to the conversion of the maximum levels in feed and food for dioxins and dioxin-like PCBs, previously expressed in Toxic Equivalent Factors (TEF) 1998, into maximum levels expressed in TEF 2005. Furthermore maximum levels for non dioxin like PCBs (the so called indicator PCBs) have been established in feed and food. Furthermore the analytical requirements, in particular for the bio-analytical methodologies have been updated.

Table 5 Food & Feed related legislation with relevance to POPs

Acronym	Legal reference	POPs regulated / POP reference
Maximum levels for certain contaminants in foodstuffs	Regulation (EC) No 1881/2006	- Dioxins (sum of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) and dioxin-like PCBs and non-dioxin-like PCBs (indicator PCBs) - benzo(a)pyrene and the sum of of benzo(a)pyrene, benz(a)anthracene, benzo(b)fluoranthene and chrysene as a marker of carcinogenic PAH in certain foodstuffs
	Regulation (EC) No 1883/2006 ³¹ shall be repealed by Regulation (EU) No 252/2012 ³²	Methods of sampling and analysis for the control of levels of dioxins and dioxin-like PCBs in food for regulatory purposes
Pesticide Residues in Food	Regulation (EC) No 396/2005	Setting Maximum Residue Levels for POP Pesticides in food products
Undesirable substances in animal feed	Directive 2002/32/EC	Aldrin, Dieldrin, Camphechlor (toxaphene), Chlordane, DDT, Endosulfan, Endrin, Heptachlor, Hexachlorobenzene (HCB), Hexachlorocyclohexane (HCH, incl. Lindane), Dioxins (sum of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) and polychlorinated biphenyls (PCBs)..
	Regulation (EC) 152/2009 ³³	Methods of sampling and analysis for checking the levels of dioxins and dioxin-like PCBs in feed for regulatory purposes

2.1.6. Information exchange between Commission and Member States on POPs in food and consumer products

The information exchange among the Member States authorities and the Commission on the presence of POPs in food and consumer products is ensured by the rapid alert systems. There are currently two EU rapid alert systems and both are publicly available. The legal basis for their establishment provides Regulation EC/178/2002, Directive 2001/95/EC and Regulation 765/2008.

The Rapid Alert System for Food and Feed (RASFF)³⁴: was put in place to provide food and feed control authorities with an effective tool to exchange information about measures taken responding to serious risks detected in relation to food or feed. This exchange of information helps Member States to act more rapidly and in a coordinated manner in response to a health threat caused by food or feed. Notifications cover e.g. the contamination of food and feed with dioxins and dioxin-like PCBs or with polycyclic aromatic hydrocarbons.

The Rapid Alert System for non-food dangerous Products (RAPEX)³⁵: RAPEX facilitates the rapid exchange of information between Member States and the Commission on measures taken to prevent or restrict the marketing or use of products (non-feed/non-food) posing a serious risk to the health and safety of consumers. Measures ordered by national authorities and measures taken voluntarily by producers and distributors are reported by RAPEX.

³⁴ http://ec.europa.eu/food/food/rapidalert/index_en.htm

³⁵ http://ec.europa.eu/consumers/safety/rapex/index_en.htm

2.1.7. Emission monitoring legislation

The European Pollutant Release and Transfer Register (PRTR) Regulation³⁶ aims to enhance public access to environmental information. The E-PRTR replaced the European Pollutant Emission Register (EPER) in 2007 and includes additional source categories (e.g. diffuse sources), additional pollutants and stricter threshold levels for a number of pollutants (including POPs) (see also sections 3.3.1 on emission monitoring and 2.2.6 on monitoring efforts of the EU).

2.1.1. Public access to environmental information

The Directive 2003/4/EC on public access to environmental information³⁷ guarantees the right of access to environmental information held by or for public authorities. This right is for any applicant (private individuals, organisations etc.) and has to be granted without any justification. With regards to emissions, no request can be refused. Thus, this directive is a powerful instrument to gather emission data, also on POPs and can be used supplementary to the above mentioned on E-PRTR.

2.2. Strategies, policies and programmes

2.2.1. Sustainable development

In 2001, the European Union adopted the EU Sustainable Development Strategy (EU SDS) to provide a long-term vision combining economic dynamism, social cohesion and high environmental standards.³⁸ In 2009, the European Commission communication COM (2009) 400 final³⁹ reviewed the EU SDS to respond to the most recent economic and financial crisis from the perspective of a long-term sustainable development with the goal to further mainstream the EU SDS into the European policy fields. From the seven key challenges proposed, two contain POPs related issues though they are not explicitly mentioned, i.e. sustainable consumption and production as well as Public health.

The review reaffirms the position of the European Council about sustainable development as a fundamental EU objective under the Treaty of Lisbon. This follow-up of the Lisbon Strategy was adopted in June 2010 by the heads and governments of the EU.

2.2.2. Environmental Action Plan

The Union's principal strategy for environmental policy is the Environmental Action Plan (EAP) covering this UIP. The sixth Environment Action Plan (6th EAP), was active during the 2002-2012 period, and sets out the framework for environmental policy-making, promotes full integration of environmental protection requirements in the Union for sustainable development, and establishes strategic approaches to meet the environmental goals and objectives. One of the 6th EAP priority areas is 'Environment and health' which aimed to reduce the hazards of environmental pollutants such as pesticides, endocrine disruptors, dioxins and PCBs in Europe and sought for a high level of quality of life and well-being for citizens, aspiring to reduce harmful effects on human health and the environment. The priority areas can be found at: <http://ec.europa.eu/environment/newprg/intro.htm>.

³⁶ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2006:033:0001:0017:EN:PDF>

³⁷ Directive 2003/4/EC of the European Parliament and the Council of 28 January 2003 on public access to environmental information and repealing Council Directive 90/313/EEC, OJ L 41, 28.1.2003, p. 26

³⁸ See communication of the Commission COM(2001) 264 final and the conclusions from the Gothenburg European Council.

³⁹ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2009:0400:FIN:EN:PDF>

Additionally, some thematic strategies were introduced in 2005 to improve environmental regulation and are of relevance to work on the elimination of POPs, like the Sustainable Use of Pesticides, Air Pollution, Urban Environment and Sustainable Use and Management of Resources. The thematic strategies of the 6th EAP are published at:

http://ec.europa.eu/environment/newprg/strategies_en.htm.

In June 2013, political agreement was reached on a new Environment Action Program (EAP). The new or '7th EAP' sets out the priority objectives for EU environment policy to 2020, set out in an ambitious longer-term vision for an inclusive, green and competitive European economy that safeguards the environment. The agreement will guide and drive actions in advancing resource efficiency, the green economy and the environmental agenda generally in the period to 2020 and beyond.

The 7th Environment Action Program: 'Living well, within the limits of our planet', builds on the achievements of previous programs which have been a key vehicle for advancing environmental improvements in the European Union. Agreement was reached with the European Parliament on a program to transition Europe towards a resource-efficient, low-carbon and environmentally-friendly economy in which natural capital is protected and enhanced, and citizens' health and well-being are safeguarded.

The Program sets out a framework to support the achievement of nine priority objectives** through development and better implementation of EU environment law, state of the art science, securing the necessary investments in support of environment and climate change policy, and improving the way that environmental concerns and requirements are reflected in other policies. The Program aims to boost efforts to help EU cities become more sustainable, and improve the EU's capacity to meet regional and global environment and climate challenges.

The Program gives citizens, businesses and policymakers the long-term view needed to make the transition to a sustainable, low-carbon society in Europe.

The main highlights of the 7th EAP are:

- The limitation of land filling to non-recyclable and non-recoverable waste by 2020, an important step towards a more fully-fledged resource management approach to waste.
- On climate and energy policy, recognition of the need for a legally binding framework beyond 2020 to enable Member States and industry to make the necessary investments in emissions reduction, energy efficiency and renewable energy, taking into account the indicative milestones set out in the Low Carbon Economy Roadmap to 2050.
- Need to address EU soil quality issues including consideration of a binding legal framework.
- Agreement on the establishment of a more coherent policy and legislative framework for sustainable consumption and production.
- Agreement on the need to establish an EU-wide quantitative reduction headline target for marine litter.
- Agreement that the combination effects of chemicals and safety concerns related to endocrine disruptors and nano-materials must be effectively addressed across all relevant EU legislation.

- Agreement on the need to further develop inspection support capacity at EU level, in order to increase the efficiency and effectiveness of inspections. This will also contribute to a more level playing field within the EU.
- Agreement on the need to phase-out environmentally harmful subsidies at Member State and EU level.
- The integration of environmental considerations including water protection and biodiversity conservation into land use planning decisions, with a view to making progress towards the objective of no net land take by 2050.

2.2.3. *Strategies for control of pesticides and chemical substances*

In July 2006, the Commission adopted a Communication on Sustainable Use of Pesticides (COM (2006) 372 final)⁴⁰ to prevent any undesirable effects and risks to humans and the environment by minimising exposure as much as possible and by encouraging the research and development of less polluting alternatives. One of the measures to be integrated through the application of already existing instruments is to provide financial and technical assistance (capacity building) in numerous programmes such as the Strategic Approach of International Chemicals Management (SAICM).

The Union Strategy for Dioxins, Furans and Polychlorinated Biphenyls adopted in 2001 (COM (2001) 593)⁴¹ has the goal to assess the current state of the environment and the ecosystem and to reduce exposure from dioxins and PCBs to humans and the environment. In July 2007, the Communication of the Commission COM (2007) 396 final⁴² provided the second progress report on the main achievements with regard to the implementation of the strategy during the period between 2004 and 2006, elucidating the several environmental measures on POPs which have been adopted in 2004 and the new maximum levels for contaminants in food and feed which have been updated in 2006.

Lately, in October 2010, the Commission adopted the third progress report on the Dioxin strategy for the period 2007 to 2009 (COM (2010) 562 final)⁴³. The report concluded that the overall objective of the Strategy, i.e. to develop an integrated approach in order to reduce the presence of dioxins, furans and PCBs in the environment as well as in feed and food, has been achieved to a large extent, bearing in mind the reduction of industrial emissions of these pollutants by about 80% over the past two decades. The report further concluded that additional sources should be targeted by national or local measures. Further progress is expected within the framework of the European Union Implementation Plan on Persistent Organic Pollutants and the relevant National Action Plans (NAPs) elaborated by Member States.

2.2.4. *Environment and Health Action Plan*

The Environment and Health Action Plan (EHAP) was launched in June 2004 to coordinate health, environment and research areas and to develop a system for integrated information on environment and health and to assess the environmental impact on human health more efficiently. In June 2007, a mid-term report was published in a communication of the

⁴⁰ http://ec.europa.eu/environment/ppps/pdf/com_2006_0372.pdf

⁴¹ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:52010DC0593:EN:NOT>

⁴² <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2007:0396:FIN:EN:PDF>

⁴³ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2010:0562:FIN:EN:PDF>

Commission (COM (2007) 314 final⁴⁴). It highlighted the growing links between environment policy and health policy. It showed, for example, that an important development in relation to the Strategy on Dioxins and PCBs was the adoption of the Regulation (EC) No. 850/2004 on POPs. The progress report on the implementation of the EHAP of March 2010 (SEC (2010) 387)⁴⁵ presented the progress of activities after the mid-term review, assessed the results achieved since 2004 and suggested the follow-up for the Action Plan post 2010.

2.2.5. *Multilateral Environmental Agreements (MEAs)*

Many environmental problems transcend national boundaries and can only be efficiently handled through international co-operation. Consequently, the 6th EAP⁴⁶ acknowledged the international dimension to achieve the objectives in the four priority areas (nature and biodiversity, environment and health, natural resources and waste, climate change), and the 7th EAP⁴⁷ continues to acknowledge the international dimension of environmental problems. At present, there are more than 500 international treaties and other environment-related agreements, 70 per cent of which are regional in scope. In addition, there are currently 45 MEAs with global geographical scope consisting of at least 72 signatory countries⁴⁸. The European Union is a contracting party in more than 40 international environmental agreements⁴⁹, among them the Stockholm Convention, the Basel Convention as well as the Rotterdam Convention.

2.2.6. *Monitoring efforts of the EU*

Monitoring efforts in the EU covers monitoring of emission loads into the environment and monitoring of environmental concentrations.

The European Monitoring and Evaluation Programme (EMEP) is a scientifically based and policies driven programme for international cooperation under the Convention on Long-range Transboundary Air Pollution (CLRTAP). The EMEP provides scientific information about emission inventories and emission projections, atmospheric monitoring and modelling as well as an integrated assessment to help solve transboundary air pollution problems. This set of information is an important basis for developing further emission control strategies and implementing the Convention and its Protocols.

Several measures relating to the monitoring of POPs' emissions have been taken by the Member States in order to identify and characterize sources and releases of these substances. Many of these measures are included in the NIPs and have benefited from the many national policy frameworks. Besides the national emission inventories for the release of unintentionally produced POPs into the air, water and soil, the EMEP emission inventory and the E-PRTR data base are further available inventories of releases.

As regards the monitoring of environmental concentrations, there are several regional monitoring programmes established as part of regional conventions or initiatives that covers part of the EU and includes some of the POPs. The Arctic Monitoring and Assessment Programme (AMAP) analyses fluxes, pathways and environmental levels of POPs and presents an assessment of the Arctic environment contamination⁵⁰. Other examples are the

50 <http://www.eea.europa.eu/publications/92-9167-058-8/page004.html>

Trilateral Monitoring and Assessment Programme of the Waddensea (TMAP), the Monitoring Network in the Alpine Region for Persistent and other Organic Pollutants (MONARPOP) as well as sea conventions (such as e.g. HELCOM and OSPAR).

The mission of the European Environment Agency (EEA) is to provide sound and independent information on the environment, with the goal to ensure that decision-makers and the general public are kept informed about European environmental data, knowledge and assessments. The Agency collects the data on POP emissions and some data on POP concentrations in the environment and analyses their trends^{51,52}. Some of the Agency's data on POPs originate from the monitoring of Priority Substances in water bodies conducted by Member States under the Water Framework Directive. In addition, Member States have contributed data on some substances to a working database specifically developed for the Commission's 2011 review of the Priority Substances list.

2.3. Financial instruments

Using different funding instruments, the European Union provides a significant amount of funding to environmental projects and programmes, both within the EU as well as in neighbouring countries and in developing countries. There are several financial instruments and programmes that can be relevant also for POP related projects.

2.3.1. Funding instruments for the EU

The LIFE programme is the financial instrument for supporting environmental and nature conservation projects and promoting policy priorities in the EU as well as in some candidate, acceding and neighbouring countries. The European Commission proposed replacing most existing environmental funding, including the former LIFE+ categories, with a single fund focused on supporting development, implementation, monitoring, evaluation and communication of Union environmental policy and legislation. This new phase is called LIFE+ and entered into force the 9th of June 2007⁵³. It ran for the period 2007-2013 with a budget of €2.143 billion, while funding was provided via three key areas: LIFE+ Nature & Biodiversity, LIFE+ Environmental Policy & Governance, and LIFE+ Information & Communication, where at least 78 percent of the budgetary resources was used for action grants to projects.

LIFE+ projects promoted synergies between different priorities under the 6th Environmental Action Plan. Two projects in relation with POPs were funded by the LIFE+ programme: one to evaluate the extent of exposure of the general population, especially women of reproductive age⁵⁴, and the second to evaluate emission exposure of PAHs in the population⁵⁵. The LIFE+ programme was designed to complement other funding programmes for the environment which are described as follows.

There are numerous other funds of the EU with different target groups that do not specifically refer to POPs, but which support the implementation of the EU environmental legislation or the supply of technical solutions (the Competitiveness and Innovation Framework

⁵¹ <http://www.eea.europa.eu/data-and-maps/indicators/eea32-persistent-organic-pollutant-pop-emissions-1/assessment>

⁵² <http://www.eea.europa.eu/publications/NYM2/page005.html>

⁵³ <http://ec.europa.eu/environment/life/funding/lifeplus.htm>

⁵⁴ http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=search.dspPage&n_proj_id=3433

⁵⁵ http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=search.dspPage&n_proj_id=3756

Programme⁵⁶, for example, supports small and medium-sized enterprises (SMEs) innovation activities (including eco-innovation), while the NGO operating grants⁵⁷ inter alia promote the active participation of NGOs in the development and implementation of environmental policy).

On the 20th of December 2013 the LIFE 2014-2020 Regulation (EC) No 1293/2013 was published in the Official Journal L 347/185. The Regulation establishes the Environment and Climate Action sub-programmes of the LIFE Programme for the next funding period, 2014–2020. The budget for the period is set at €3.4 billion in current prices.

On the 19th of March 2014, the LIFE multiannual work programme for 2014-2017 was adopted by a Commission Decision, after having received a positive opinion of the Committee for the LIFE Programme for the Environment and Climate Action on 17 February 2014. The work programme applies from the date of its adoption and enters into force as of its publication in the Official Journal of the European Union.

The LIFE multiannual work programme for 2014-2017 sets the framework for the next four years for the management of the new LIFE Programme 2014-2020. It contains an indicative budget, explains the selection methodology for projects and for operating grants and establishes outcome indicators for the two LIFE sub-programmes – for Environment and for Climate Action. The total budget for funding projects during the period covered amounts to €1.1 billion under the sub-programme for Environment and €0.36 billion under the sub-programme for Climate Action.

2.3.2. *Funding for neighbouring and partner countries*

The European Neighbourhood and Partnership Instrument (ENPI) is designed to target sustainable development and approximation to EU policies and standards – which includes the implementation of the POP regulation as well – in neighbouring third Countries as well as through a strategic partnership with the Russian Federation.⁵⁸ This programme replaces the former programmes MEDA, TACIS and EIDHR mentioned in the first Implementation Plan. For the period 2007-2013, nearly €12 billion in EU funding are available to support these partners' reforms. The ENPI has 15 cross-border cooperation (CBC) programmes which receive a funding of €1.18 billion for the same period. The Instrument for Pre-Accession Assistance (IPA)⁵⁹ which replaces several programmes (e.g. the PHARE programme) and financial instruments for candidate countries (Croatia, Iceland, Turkey and the former Yugoslav Republic of Macedonia) or potential candidates (Albania, Bosnia and Herzegovina, Montenegro, Serbia, Kosovo) also provides nearly €12 billion. Most African, Caribbean and Pacific States benefit from development support under the Cotonou Convention financed through the European Development Fund (€23 billion for the period 2007 – 2013) while South Africa and other developing countries, notably in Asia and Latin America benefit from the Development Cooperation Instrument (over €17 billion for 2007 – 2013).

Within the DCI is a substantial specific programme for environmental support, open to all partners except actual and potential candidates, the “Thematic programme on environment

⁵⁶ http://ec.europa.eu/cip/index_en.htm

⁵⁷ http://ec.europa.eu/environment/ngos/index_en.htm

⁵⁸ http://ec.europa.eu/world/enp/funding_en.htm

⁵⁹ http://europa.eu/legislation_summaries/agriculture/enlargement/e50020_en.htm

and sustainable management of natural resources, including energy” (Thematic Programme for Environment and Sustainable Management of Natural Resources (ENRTP), worth about €1.1 billion for the period 2007-2013)⁶⁰. This programme has provided support to the work of Secretariat of the Stockholm Convention and has also funded projects on the ground.⁶¹

2.3.3. *Multilateral programmes funded by the EU*

The promotion of measures to address worldwide environmental problems is a key objective of the EU policy. The Commission thus provides funding to international and multilateral programmes:

The European Commission has its own specific programme for environment and climate change, the ENRTP which has been used to support multilateral programmes. Some examples funded within the ENRTP:

- The further elaboration of the dioxin and furan toolkit: €100,000 in 2007, to better adapt the toolkit guidance to the needs of developing countries by including the type of industrial installations and levels of pollution found in those countries.
- The evaluation of the Convention’s effectiveness: €400,000 has been allocated in 2009 for completing data on the levels of POPs in the air, and in breast milk for Africa, Latin America and the Caribbean to establish an adequate baseline for further evaluations.
- Support to the Secretariat of Stockholm convention of €480.000 in 2010 to support Parties to implement their obligations under the Stockholm Convention, i.e. developing countries in the following regions: Africa, Asia, Latin America and the Caribbean, and Middle East and countries with economies in transition in CEE.
- Support to the Secretariat of Stockholm convention of €1.450.000 in 2011 to support their 2012-2013 programme of work, including the technical assistance programme, the global monitoring plan for effectiveness evaluation, the programme on unintentionally produced POPs, the programme on endosulfan, the programme on new POPs and candidate POPs and support for participation of developing countries at COP-6.
- Further ENRTP support includes €4.5 million to FAO for the cleaning up of obsolete pesticides in the Africa Stockpiles Programme;

The European Commission has also provided is providing substantial financial support to the **Strategic Approach to International Chemicals Management (SAICM)**⁶², promoting sound chemicals management worldwide through both the ENRTP and the European Development Fund (EDF).

⁶⁰ http://ec.europa.eu/europeaid/how/finance/dci/environment_en.htm

⁶¹ http://ec.europa.eu/environment/pops/pdf/convention_stockholm_en.pdf

⁶² <http://www.saicm.org/index.php?ql=h&content=home>

2.4. Research and Development and the Framework Programmes

Research and development is essential for the support of policies such as, inter alia, consumer protection or the protection of the environment. The Research Framework Programme (FP) is the main instrument for funding research and development in Europe.

The Sixth Research Framework Programme (FP6) ran between 2003 and 2007 with a budget of €17.5 billion. Within FP6, 37 projects out of the 66 projects funded⁶³ addressed some aspects of chemical safety. However, a smaller number of projects focused on exposure to and potential health impacts of POPs. **Error! Reference source not found.** shows the research projects within the FP6; besides nine large-scale projects in FP6⁶⁴, the table focuses on projects with starting dates in 2007 and later.⁶⁵

The Seventh Framework Programme (FP7) which has been recently replaced by Horizon 2020, ran for the period 2007-2013 with a total budget of over € 50.5 billion from which € 1.89 billion was attributed to the relevant thematic areas of ‘Environment (including Climate Change)’, €1.94 billion to ‘Food, Agriculture and Fisheries, and Biotechnology’ and € 6.1 billion to ‘Health’. These thematic areas particularly supported research on projects related to POPs (see Table 8). The programmes ‘Ideas’ (€7.5 billion over 7 years) and ‘People’ (€4.7 billion over 7 years) of the FP7 also funded some projects with reference to POPs. The thematic areas and programmes are indicated in Table 8 (second column). The primary aim of funding the ‘Food, Agriculture and Fisheries, and Biotechnology’ research theme under the FP7 was to build a European Knowledge Based Bio-Economy, KBBE being the abbreviation for this thematic area.

Thirtyseven projects with POP relevance have been funded under the FP7 receiving around €143 million from the EU. Projects with POP reference have especially been funded within the framework of the thematic area ‘Environment’ – 22 projects– as it included the environment and health sub-activity. This sub-activity funded research to support EU policy initiatives such as the European Environment and Health Action Plan 2004-2010, the Community Strategy for Endocrine Disruptors, and the Stockholm Convention on persistent organic pollutants (POPs). The projects funded deal with, inter alia, harmonising human (bio)monitoring, in Europe, and improving the understanding of environmental and human exposure to chemicals such as PCBs and perfluorinated compounds⁶⁶ and their potential health effects.

Within the thematic strategy ‘Food, Agriculture and Fisheries, and Biotechnology’ / ‘Knowledge Based Bio-Economy’, nine large POP-projects were funded, focussing on food safety aspects such as sampling strategies and detection methods for specific foods and on quality and safety assurance of feed. Furthermore under this thematic area, projects are funded seeking alternative solutions to chemical pesticides.

⁶³ http://ec.europa.eu/research/environment/pdf/european_research_on_environment_and_health_fp6.pdf

⁶⁴ NORMAN Network of reference laboratories and related organisations for monitoring of emerging environmental pollutants; OSIRIS - Optimized strategies for risk assessment of industrial chemicals through integration of non-test and test information; NEWGENERIS - Newborns and genotoxic exposure risks; DEVNERTO - Toxic threats to the developing nervous system; PIONEER – Puberty onset – influence of nutritional, environmental and endogenous regulators; ATHON - Assessing the toxicity and hazard of non-dioxin-like PCBs present in food; CASCADE – Chemicals as contaminants in the food chain; PHIME – Public health impact of long-term, low-level mixed element exposure in susceptible population strata; BENERIS – Benefit-risk assessment for food: an iterative value-of information approach.

⁶⁵ The first ECIP summarizes the research projects of 6FP that were granted until beginning of 2007.

⁶⁶ http://ec.europa.eu/research/environment/pdf/fp7_catalogue_eh.pdf.

In 2007, the Commission also saw the need to examine development of affordable alternatives to DDT to control malaria, e.g. by exploiting available biological knowledge on the mosquito vector. On the topic of “affordable alternatives for DDT”, no research project was granted within FP7. As for identification of substances that can be used as alternatives to POP, there is one research project on substitution options for specific brominated flame retardant.

2.4.1. *European Research Institutions including the JRC*

The Joint Research Centre (JRC) has been established as part of the European Commission in 1958. As the Commission's in-house science service, the Joint Research Centre's mission is to provide EU policies with independent, evidence-based scientific and technical support throughout the whole policy cycle. Working in close cooperation with policy Directorates-General, the JRC addresses key societal challenges while stimulating innovation through developing new methods, tools and standards, and sharing its know-how with the Member States, the scientific community and international partners. The JRC holds an annual budget of around €330 million for direct support to EU institutions within the FP7 which is distributed in seven institutes. Some of these have relevant projects with POPs. The Institute for Reference Materials and Measurements (IRMM), for example, develops and provides testing methods and reference material also for POP substances. The Institute for Environment and Sustainability (IES) performs monitoring of POPs, supports the development and standardization of analytical protocols in the frame of the European Committee for Standardization and within the Water Framework Directive and supports the implementation of the Stockholm Convention at the EU level. The Institute for Health and Consumer Protection (IHCP) provides, for example, a decision-support instrument to assess chemical substances called the European Union System for the Evaluation of Substances (EUSES), manages the European centralised Database of EXport and IMport of certain hazardous chemicals and pesticides (EDEXIM) and offers training in handling the export-import notifications of pesticides and POPs. Within the Institute for Prospective Technological Studies (IPTS), the Best Available Techniques Reference Documents (BREFs) are elaborated based on the IPPC Directive / IED. Currently, there are 33 BREFs available⁶⁷ and their revision has been started. Under the IED, the BAT conclusions of the BREF will be adopted as Commission Implementing Decisions⁶⁸. Several of the BREFs also contain information on POPs and related BAT as well as the corresponding emission levels associated with the application of BAT (BAT-AELs).

Moreover, the JRC (Institute for Environment and Sustainability, IES) performs multimedia monitoring of POPs at EU and global level, based on the monitoring requirements in the Stockholm Convention. In addition, it provides guidance and experimental support to the "Toolkit Expert Group" in terms of the estimation of worldwide unintentional releases of POPs. Furthermore, the DG JRC is involved in several research activities that include monitoring programmes and case studies for inland and marine waters, ambient air, soil

⁶⁷ The BREFs can be downloaded from the website of the European IPPC Bureau, <http://eippcb.jrc.es/>

⁶⁸ Commission Implementing Decision 2012/119/EU of 10 February 2012 laying down rules concerning guidance on the collection of data and on the drawing up of BAT reference documents and on their quality assurance referred to in Directive 2010/75/EU of the European Parliament and of the Council on industrial emissions, OJ L 63/1, 2.3.2012

including contaminated sites, sediments, sewage sludge, compost, food and biota, as well as multi-media modelling of POPs.⁶⁹

2.4.2. *Supporting co-operation, co-ordination and networking*

Modern research in a global environment necessitates co-operation at different levels. The fragmentation of Europe's efforts cannot be overcome without determined actions at European level. Taking up this challenge, the European Commission, Member States and the European Parliament, the scientific community and industry are committed to work jointly towards the creation of a "European Research Area" (ERA). The European Commission published a Green Paper on ERA in April 2007. In 2008, the Member States and the Commission launched a new political partnership, called the "Ljubljana Process", which aims to overcome fragmentation and to build a strong ERA. Besides, they adopted a shared ERA 2020 vision. Concrete progress was being made via a series of new partnership initiatives proposed by the Commission in 2008.

As called by the Council, the building of the ERA will have to be completed by 2014 and in this respect all conditions have to be put in place to make the ERA fully functioning, since the realisation of the ERA in the context of the Innovation Union is a necessary component of the Europe 2020 strategy to create growth and jobs. This is clearly indicated by the ERA Communication 2012/392 and in particular in its second priority 'optimal transnational co-operation and competition

2.4.3. *Future research and innovation*

Future research needs have been addressed by a workshop specifically dedicated to this topic, as 2011 marks the ten year anniversary of the Stockholm Convention⁷⁰. The workshop was organised by the Research Centre for Toxic Compounds in the Environment and held in Brno from 22.-24.5.2011. The outcomes of the workshop listing identified knowledge gaps and research needs can be found at the institute website⁷¹.

The ongoing discussion on the fate of newly listed POPs present in articles of everyday use and on the associated challenges with recycling and disposal of such articles will certainly result in identification of additional research needs.

Horizon 2020 and in particular Societal Challenge 1 "Health, Demographic Change and Wellbeing", Societal Challenge 2 "Food Security, Sustainable Agriculture and Forestry, Marine, Maritime and Inland Water Research and the Bioeconomy" and Societal Challenge 5 "Climate Action, Environment, Resource Efficiency and Raw Materials" provide new opportunities for Research and Innovation to develop new solutions to prevent and detect POPs contamination and toxicity to the environment and human health, including marine wastes, pesticides in agriculture and food products.

⁶⁹ <http://ies.jrc.ec.europa.eu/the-institute/units/rural-water-and-ecosystem-resources-unit/action-22001.html>

⁷⁰ Recetox workshop "Identifying the research needs in the global assessment of toxic compounds ten years after the signature of the Stockholm Convention".

⁷¹ <http://www.recetox.muni.cz/index-en.php?pg=events--presentations-pops-workshop>

2.5. Information Exchange, Public information, awareness and education

The EU institutions are committed to ensuring transparency and the involvement of stakeholders and the general public. This is stipulated in the Regulation 1049/2001 on public access to EU documents and transparency in the decision-making processes and in the communication from the Commission 2002/704 towards a reinforced culture of consultation and dialogue. The public access to environmental information is specifically laid down in Directive 2003/4/EC.

The main instruments for transparency and **information access** are the Europa website and a specific website dedicated to POPs⁷². In addition the European Commission hosts databases such as Eur-Lex, statistic databases of Eurostat, the E-PRTR⁷³, the EU pesticide database⁷⁴, and databases of EU institutions on specific topics such as the European Chemical Substances Information System⁷⁵. The Directorate General for Environment maintains the POP-specific website containing information on Union legislation and POP-related research projects. Moreover, the European Environment Agency (EEA) publishes a substantial amount of information relevant to POPs⁷⁶.

In addition the general public or any interested stakeholder can have access to information on SVHC substances⁷⁷ in articles in the context of the REACH Regulation. A request can be sent to the supplier of an article who has to provide a reply within 45 days⁷⁸.

Consultations with stakeholders are an integral part of the Union's environment policy and provide the opportunity for authorities, civil society and individual citizens to provide input. Accordingly, the draft Implementation Plans are also subject to an open consultation process.

In keeping with the EU's principle of subsidiarity, public information, awareness raising and education on POPs fall within the remit of the Member States, while the POP regulation urges the Member States to provide awareness programmes and public information. A summary of the activities at Member State level can be found in the second synthesis report.⁷⁹

The Commission and Member States exchange information at regular Competent Authority meetings where national representatives for POP issues meet. Core topics are: data gathering via reporting obligations under the POP Regulation as well as further improvement in the context of reporting formats.

3. OVERALL ASSESSMENT OF THE POPs ISSUE IN THE EU

At European Union level, significant progress towards the elimination of POPs has been achieved. Production and use of all POP substances is prohibited with some minor

⁷² http://ec.europa.eu/environment/pops/index_en.htm

⁷⁸ According to Article 33 of the REACH Regulation.

⁷⁹ BIO IS (2011): Technical Support on Reporting Obligations and Update of the Community Implementation Plan under POP Regulation. ENV.D.3/SER/2010/0068r. Synthesis report. June 2011.

exemptions that are decreasing. A main challenge for the EU is to eliminate POPs from the waste cycle and remaining stockpiles as these still present a major emission source.

The following sections briefly introduce the situation in the EU for the different POP substances.

3.1. POPs regulated before 2009 (“old POPs”)

The term “old POPs” covers the substances listed in the Stockholm Convention or the POP Protocol and regulated by the POP Regulation at EU level before 2008, i.e. before the new POP substances were listed in the Stockholm Convention or the POP Protocol in 2009 and 2011 (cf. section 3.2). The data on old POPs presented in the following sections are based on the second synthesis report⁸⁰ covering 2007-2009 annual reports and the 2007-2009 triennial reports of the Members States.

3.1.1. Production

The old POPs are no longer produced in the EU.

The specific exemption of the use of DDT in dicofol production has been withdrawn from the POP Regulation. The Commission decided on the non-inclusion of dicofol in Annex I to Council Directive 91/414/EEC and on the withdrawal of authorisations for plant protection products containing that substance (2008/764/EC)⁸¹ in 2008. According to the Commission Decision, all existing authorizations for dicofol in plant protection products had to be withdrawn before 30 March 2009. National registration of dicofol was no longer possible after March 2009. Any transition period granted by the Member States expired by 30 March 2010. Up to the year 2008, dicofol has been produced by Montecinca SA. at Monzón, Spain. The yearly production amounted to approx. 1500 tonnes. Production was discontinued in 2009, when the registration for Spain expired. Until 2009, dicofol⁸² was furthermore formulated and used in Italy⁸³.

3.1.2. Use and placing on the market

The use of the old POPs listed in Annexes A and B has been progressively phased-out in the EU. The specific exemption for use of lindane as public health and veterinary topical insecticide has expired in the EU by 31.12.2007. Remaining uses of old POPs are only in articles that were produced and placed on the market before the entry into force of the POP Regulation and as standards for research purposes. Both remaining uses are covered by general exemptions granted in the Stockholm Convention and the POP Regulation. Some illegal placing on the market of medicinal products containing lindane and fireworks containing hexachlorobenzene has been reported by some Member States in the period 2008-2010. The enforcing authorities of the Member States have intervened to stop these illegal practices and ensured a proper disposal of the products.

3.1.3. Import and export

Waste containing POPs (e.g. obsolete pesticides or contaminated equipments) is being imported into some EU Member States for the purpose of its disposal and elimination. These

⁸⁰ http://ec.europa.eu/environment/pops/pdf/syntesis_report2.pdf

⁸¹ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2008:262:0040:0041:EN:PDF>

⁸² Dicofol meets the Annex D criteria of SC

⁸³ <http://www.unece.org/env/lrtap/TaskForce/popsxg/2010/Exploration%20of%20management%20options%20for%20Dicofol%20final.pdf>

imports originate from EU and non-EU countries that lack adequate technology for proper disposal of such waste. These imports are being undertaken in accordance with the provisions of the Stockholm Convention and they contribute to the overall reduction of POPs in the EU and globally.

Some illegal imports of POPs embedded in products have occurred in the period 2007-2009. Lindane has been imported as part of the pharmaceutical product and hexachlorobenzene was imported as part of fireworks. As mentioned in the sub-section 3.1.2, the enforcing authorities took appropriate measures to prevent placing on the market of those products and ordered their elimination.

There is very little export of POPs outside the EU. In the period 2007-2009, few kilograms of lindane have been exported from one Member State out of the EU under the exemption for standards for research purposes.

3.1.4. Stockpiles and waste

In a few Member States there are still stockpiles of obsolete pesticides which contain POP substances (or are most likely to) and for which production, use and placing on the market are now strictly forbidden under the POP Regulation. This stockpiles amount to less than 50.000 tonnes, estimated to contain between 2.000 and 9.000 tonnes of POPs. Some stockpiles exist where the POP substances are embedded in formulations (this was reported for lindane and Heptachlor). Reported stockpiles are subject to corresponding management measures.

PCB disposal by end of 2010

The Convention's objective is to eliminate the use of PCBs in equipment by 2025 and to make determined efforts to achieve environmentally sound waste management of liquids and equipment with PCBs by 2028.

The EU has already transposed this requirement into Directive 96/59/EC on the disposal of PCBs and PCTs (PCB Directive) (cf. section 0). It requires the Member States to compile inventories of large PCB equipment (equipment containing more than 5 dm³ PCB) and to send them to the Commission by September 1999. Moreover, the equipment and PCBs contained in the inventories had to be decontaminated or disposed of by 31.12.2010 at the latest.

In compliance with the PCB Directive, inventories of PCB containing equipment, as well as action plans for their disposal and collection were compiled by all Member States.

In December 2011, the Commission launched a survey, sending questionnaires to the competent authorities of the Member States requesting information about PCB wastes. The survey has showed that the progress made in the EU towards the safe disposal of large PCB equipment, resulting in the elimination and decontamination of the wide majority of large PCB equipment that existed in the EU. However, despite the efforts undertaken, significant quantities of PCB equipment are still in use, and only few Member States have achieved to decontaminate or to dispose of the entirety of the large PCB equipment.

The survey has showed the lack of reliable and comparable data in the EU: reporting has been in some cases incomplete and in some cases, the number of pieces of equipment instead of the PCB content (expressed in kg or tonnes) were reported. Some Member States did not distinguish between equipment containing more than 500 ppm PCB and equipment containing more than 50 ppm PCB, as is done in the Directive. In view of these inconsistencies, it is not possible to establish the precise remaining amount of the remaining amounts of PCB equipment and PCB waste.

In the survey, MS were also invited to explain the problems they have encountered when decontaminating and disposing of PCB waste. Several MS have discovered that some owners did not notify the existence of PCBs, which has led to unexpected quantities of PCB wastes to be managed by the MS. In addition, legal uncertainty (some owners of PCB wastes were involved in bankruptcy processes) and economic problems, as well as the lack of appropriate treatment facilities in some countries, have been cited as obstacles to a timely decontamination and disposal of the large PCB equipment.

In those cases where the deadline for the disposal and decontamination of large PCB equipment has not been met and in those cases where MS did not provide any information, the Commission is taking legal steps.

3.2. POPs regulated from 2009 (“new POPs”)

The new POPs are the substances that were listed in the Stockholm Convention at the 4th, 5th and 6th Conference of the Parties (COP) to the Stockholm Convention held in May 2009⁸⁴, in April 2011 and in May 2013, respectively, and in the POP Protocol at the 27th meeting of the Executive Body of LRTAP Convention held in December 2009⁸⁵ and that were not listed in any of these instruments before. Thus, the new POPs are tetra-, penta-, hexa-, and hepta-BDE (Polybrominated diphenylethers; PBDEs), Pentachlorobenzene (PeCB), PFOS (including salts) and PFOSF, endosulfan, short-chained chlorinated paraffins (SCCPs), hexachlorobutadiene (HCBd) HBCDD and polychlorinated naphthalenes (PCNs). With the exception of HBCDD, these substances have been included in the POP Regulation.

Prior to their listing the new POPs were subject to prohibition or severe restrictions in the EU. With the new amendments of the POP Regulation, certain restrictions go further than previously was the case in order to comply with the new international commitments.

In this context it needs to be highlighted that PBDEs and PFOS in contrast to the other new POPs will continue to challenge the management of certain waste streams due to the long life-span of the major product groups containing them (e.g. vehicles, electronics), and due to the fact that they are contained in products that are being (ESWI 2011⁸⁶).

The following table gives a first overview on the situation concerning the new POPs. Please, note that the figures from ESWI are estimates. Further information on the individual substances is given in the sections below.

3.2.1. Endosulfan

Endosulfan is an insecticide that has been used since the 1950s to control crop pests, tsetse flies and ecto parasites of cattle and as a wood preservative. Its production in the EU stopped in 2006/2007. Export, however, has been allowed to continue until banned by Regulation (EU) 649/2012/2008.

Germany was the second-largest endosulfan producer after India (approximately 4.000 tonnes per year) while historic production in Europe amounted to 10.000 to 50.000 tonnes per year⁹¹.

In the EU, the use of endosulfan in plant protection products was not authorised as endosulfan was not approved under Regulation (EC) 1107/2009 concerning the placing of plant protection products on the market, which replaces Council Directive 91/414/EEC of 15 July 1991. However, by way of derogation from the provisions of this Regulation under special circumstances a Member State might authorise for a period not exceeding 120 days the placing of plant protection products containing endosulfan on the market for a limited and controlled use. Some Member States have made use of this for e.g. the use as an insecticide for hazelnut (harmful organism – *Curculio nucum*), the use as rodenticide for rape, orchards, starchy cereals crops (harmful organisms – *Microtus arvalis*) or the use in plant protection products and in antifouling products.

As a consequence of listing of Endosulfan in Annex A of the Stockholm Convention, its production, placing on the market and use has been banned by adding it to the appropriate Annex of the POP Regulation (Regulation (EC) No 850/2004).

Further information such as relating to endosulfan stockpiles in the EU Member States is not available.

3.2.2. Tetrabromodiphenyl ether and pentabromodiphenyl ether

Tetrabromodiphenyl ether (TetraBDE) and pentabromodiphenyl ether (PentaBDE) are the main components of commercial pentabromodiphenyl ether (C-PentaBDE) that is an additive flame retardant.

The use and placing on the market of C-PentaBDE has been banned in the EU already since 2004 by the Directive 2003/11/EC⁹². Since June 2009, these restrictions for C-PentaBDE were taken up in REACH Annex XVII on restrictions on the manufacture, placing on the market and use of certain dangerous substances, preparations and articles by the Regulation 552/2009⁹³. The RoHS Directive 2011/65/EC⁹⁴ inter alia restricts the use of Polybrominated Diphenylethers (PBDEs) in electrical and electronic equipment (EEE). The maximum concentration values in new EEE is 0.1 % by weight (1,000 ppm) in homogeneous material and applies to the sum of PBDE congeners. Tetra- and Penta-BDEs, the main components of

⁹² Directive 2003/11/EC of the European Parliament And Of The Council of 6 February 2003 amending for the 24th time Council Directive 76/769/EEC relating to restrictions on the marketing and use of certain dangerous substances and preparations (pentabromodiphenyl ether, octabromodiphenyl ether) <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2003:042:0045:0046:EN:PDF>

⁹³ Commission Regulation (EC) No 552/2009 of 22 June 2009 amending Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) as regards Annex XVII; <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:164:0007:0031:EN:PDF>

⁹⁴ Directive 2011/65/EU of the European Parliament And Of The Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment (recast)

C-PentaBDE, are now regulated by the POP Regulation which bans their production, placing on the market and use. Derogation is granted for production, placing on the market and use of electrical and electronic equipment within the scope of RoHS Directive, i.e. the EEE must comply with the maximum concentration values. Further, relevant legal documents on EU-level addressing PBDE is the Water Framework Directive 2000/60/EC⁹⁵ and the PRTR Regulation (EC) No 2006/166⁹⁶.

Since 1997, TetraBDE and PentaBDE have no longer been produced in the EU (ESWI 2011). These substances were mainly used in applications with a high lifetime, such as in automotive and upholstery applications that are still in use (see footnote 97).

The most common use of C-PentaBDE in Europe was in flexible polyurethane foam (95%) that was mainly used for upholstery and automotive applications, thus applications with a high lifetime. For these two sectors the overall discharge of C-PentaBDE in Europe is estimated by ESWI 2011 at 355 t/y with an overall distribution of the discharge of ~6 % (21 t/y) as emissions and ~94 % (334 t/y) for waste.

The contribution to the waste is ~105 t/y for TetraBDE and ~200 t/y for PentaBDE.

As for automotive applications, assuming a lifetime of 12 years and a phase out in 2000⁹⁷, the majority of C-PentaBDE in automotive applications has already been disposed of⁹⁸. ESWI (2011) estimates the current amount of C-PentaBDE present in automotive applications in the EU at 258 t in 2010. As for waste, ESWI estimates that 243.3 t of C-PentaBDE present in automotive waste is landfilled (~98.5 t), incinerated without energy recovery (~98.5 t), incinerated with energy recovery (~17.0 t) and recycled (~29.0 t).

The accumulated amount of C-PentaBDE in upholstery applications for 2010 is estimated at 321 t. ESWI (2011) stated that the upholstery sector currently contributes about 96.95 t/y. Hereof, around 91.31 t of C-PentaBDE in upholstery applications have to be treated in the EU in 2010. The C-PentaBDE has been landfilled (~61.3 t), incinerated without energy recovery (~18.4 t) and incinerated with energy recovery (~11.6 t). With the assumed life time of 10 years all C-PentaBDE in upholstery applications will be disposed of by 2014.

As regards the relevant exports, no further information is available.

3.2.3. *Hexabromodiphenyl ether and heptabromodiphenyl ether*

Hexabromodiphenyl ether (HexaBDE) and heptabromodiphenyl ether (HeptaBDE) are the main congeners of the commercial octabromodiphenyl ether mixture (C-OctaBDE). Production of these substances has ceased within the EU in 1996/98.

C-OctaBDE has historically mainly been used as a flame retardant in Acrylonitrilebutadiene-styrene (ABS) polymers with a concentration between 10-18 % by weight (95% of its use in

⁹⁵ Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy

⁹⁶ Regulation (EC) No 166/2006 of the European Parliament and of the Council of 18 January 2006 concerning the establishment of a European Pollutant Release and Transfer Register and amending Council Directives 91/689/EEC and 96/61/EC

⁹⁷ According to information from the European Automobile Manufacturers Association (ACEA), the automotive industry voluntarily phased out C-PentaBDE latest from 2000 even though the legislative ban came into force only in 2004.

⁹⁸ Other assumptions could be made that could lead to different estimations: According to information from a car recycler, the average age of ELVs in the Netherlands is 16 years. Assuming a corresponding lifetime and a phase out in 2004, the majority of C-PentaBDE in automotive applications would be disposed of around latest 2020.

the EU compared to 70% globally). ABS in turn was mainly used for housing of Electrical and Electronic Equipment (EEE), typically office equipment and business machines. Throughout the 90's C-OctaBDE in ABS was increasingly replaced by alternative flame retardants such as Tetrabromobisphenol A. Besides, there was a shift from the ABS (90's) towards PC/ABS and HIPS for outer casings.

Like C-PentaBDE, the use of C-OctaBDE was already banned in the EU in 2004 by the Directive 2003/11/EC and in June 2009 by inclusion in Annex XVII of the REACH Regulation (Regulation 552/2009). Furthermore, the placing on the market of electrical and electronic equipment containing C-OctaBDE is also regulated under the RoHS Directive (2011/65/EU). Hexa- and Hepta-BDEs including in C-OctaBDE are now regulated by the POP Regulation which bans their production, placing on the market and use. Derogation is granted for production, placing on the market and use of electrical and electronic equipment within the scope of RoHS Directive, i.e. the EEE must comply with the maximum concentration values.

The annual amount of C-PentaBDE mainly from electronics entering the environment in the EU was estimated by ESWI (2011) to be approximately 131 t in 2010, of which 128 t are contained in end-of-life equipment (corresponding to ~8 t/y of PentaBDE, ~8 t/y of HexaBDE and ~45 t/y of HeptaBDE) and 3 t are emitted directly from the products. According to one scenario included in the ESWI study, out of these 128 t of C-PentaBDE wastes, 66 t are incinerated, 40 t are landfilled, and 23 t recycled. Another scenario is based on the assumption that C-OctaBDE contaminated plastics are separated from the waste electronics fraction, as requested by the WEEE Directive (2002/96/EC). The contaminated plastic waste fraction (128 t) would then be incinerated (ESWI 2011).

According to the ESWI study, it is estimated that all C-OctaBDE contained in EEE will have been disposed of by the end of 2012.

A significant amount of used and end-of-life electrical and electronic equipment (EEE) is being illegally exported outside the EU, most of it being declared as still functioning EEE. For instance, a recent study published by the German UBA and German Federal Ministry for Environment, Nature Conservation and Nuclear Safety⁹⁹ indicates that in 2008 between 93.000 t and 216.000 t were exported from the port of Hamburg (Germany) to non-European destinations. Other studies carried out in Ghana and Nigeria – two of the main destinations of these exports where approximately 85% of the EEE imports originate from the EU – suggest that a significant portion of these products are either repaired locally and reused as second-hand-products (70%) or directly recycled by informal scrap metal workers (30%). In both cases, end-of-life management is largely unregulated and frequently makes use of open fires to liberate copper from wire insulation or to reduce plastic waste volumes, generating

⁹⁹ Sander, K.; Schilling, S. (2010): Transboundary shipment of waste electrical / electronic equipment / electronic scrap – Optimization of material flows and control.

significant amounts of POPs (Prakash & Manhart 2010¹⁰⁰, Manhart et al. 2011¹⁰¹, Schluiep et al. 2011¹⁰²)

In the EU, only a few full scale e-waste recycling facilities separate PBDE containing plastic. One facility with automatic separation step for WEEE plastic containing halogens (including BFRs) is known in Switzerland (UNEP 2011)¹⁰³. Therefore, there are some doubts whether the capacity of European WEEE recycling plants for separation of PBDE (BFR) containing plastic from other plastic are currently sufficiently developed to separate a major part of PBDE/BFR containing plastic.

Furthermore, thermoplastics (i.e. mainly outer casings) separated from waste EEE is also being exported to non-European countries on a regular basis, where it is used as recyclate for the plastics industry, which might in some cases lead to cross-contamination of products and thus unintentional POPs-production through improper end-of-life treatment of these products (Manhart 2012¹⁰⁴).

Also, screening of plastic products has revealed that even sensitive uses like children toys (Chen 2009)¹⁰⁵ along with household goods (Chen 2010)¹⁰⁶ are contaminated with PBDE and other BFRs. Concluding on the above, there is thus no evidence that the flow of plastics recovered from WEEE and containing PBDE is properly controlled in recycling operations.

3.2.4. *Perfluorooctane sulfonic acid (PFOS), its salts and perfluorooctane sulfonyl fluoride*

Perfluorooctane sulfonate is a fully fluorinated anion, which is commonly used as a salt or incorporated into larger polymers.

The use of PFOS, its salts and other derivatives has been restricted in the EU since 2008 by Directive 2006/122/EC¹⁰⁷. These restrictions were later taken up in REACH Annex XVII by Regulation 552/2009. Now, the production, placing on the market and use of PFOS, its salts and other derivatives is regulated under the POP Regulation. Exemptions granted by the POP Regulation are significantly less numerous than in the Stockholm Convention, as alternatives are available to many of those uses. The derogation is given for production and placing on the market for the following uses (a) until 26 August 2015, wetting agents for use in controlled electroplating systems; (b) photoresists or anti-reflective coatings for photolithography processes; (c) photographic coatings applied to films, papers, or printing plates; (d) mist suppressants for non-decorative hard chromium (VI) plating in closed loop systems; (e) hydraulic fluids for aviation.

The production of PFOS in the EU has basically been phased out between 2000 and 2004. Due to the existing exemptions in the POP Regulation however, a minor production still takes place in Germany and Italy but quantitative data on it is not available.

The current use in the EU includes the metal plating industry (6,500 kg/y), use in hydraulic fluids in the aviation industry (730 kg/y), photographic industry (562 kg/y used + ~1,280 kg from historical storage) and semiconductor industry (9.3 kg/y). PFOS has been also present in the fire fighting foams (90 t in stocks) which however had to be destroyed by 27 June 2011 and there are known some stockpiles of PFOS from historical usage in photographic industry (1,280 kg) (ESWI 2011). In the past PFOS were used as surface-active agents in different applications and products, in coatings and coating additives, in carpets and textiles, in rubber and plastics, in upholstery and in the leather industry. Products with a relatively long lifetime will thus still enter the waste stream and contaminate it with PFOS. i.e. carpets or (leather) upholstery.

The total amount from the past uses is about 1.730 t/y PFOS. The overall discharge of PFOS in Europe accounts for about 165 t / y. Hereof, the major waste stream from all sectors are dominated by the carpet sector (~94 %), followed with great distance by fire fighting foams (~5 %) and the leather industry (~1 %). The most relevant source for emission to the environment are fire fighting foams with ~52 % followed by metal plating ~43 % further the photo industry with 3 % and hydraulic fluids with 1.7 %. One probably underestimated sector in this first very rough substance flow assessment is the textile and the furniture sector which were a major use sector of PFOS (ESWI 2011)¹⁰⁸.

The majority of PFOS waste is currently disposed of on landfills for non-hazardous waste (63%) followed by non-hazardous incineration (31%). It is estimated that only 1.31 % of all PFOS containing waste is currently reused or recycled. The remaining PFOS containing waste is destroyed in hazardous waste incineration plants (ESWI 2011).

¹⁰⁷ Directive 2006/122/EC of the European Parliament and of the Council of 12 December 2006 amending for the 30th time Council Directive 76/769/EEC on the approximation of the laws, regulations and administrative provisions of the Member States relating to restrictions on the marketing and use of certain dangerous substances and preparations (perfluorooctane sulfonates);
<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2006:372:0032:0034:EN:PDF>

¹⁰⁸ All figures in this section are estimations made by ESWI 2011

3.2.5. *Pentachlorobenzene (PeCB)*

Pentachlorobenzene (PeCB) was listed as new POP in Annex A and C of the Stockholm Convention in May 2009. It is now regulated by the POP Regulation which bans its production, placing on the market and use.

Therefore, it is not being intentionally produced or used anymore within the EU. Historic intentional uses within Europe comprised the application together with polychlorinated biphenyls (PCBs) in electrical equipment, as flame-retardant and as intermediate in the production of the pesticide quintozene. ESWI (2011) estimated that the current most relevant source of PeCB production and emission are incineration and combustion processes of different wastes/materials including coal¹⁰⁹. Emissions of PeCB to the environment (mainly air and to a lesser degree soil) were estimated from ESWI to approximately 2.324 kg/y with the main contribution resulting from power production from coal (ca. 83%) followed by domestic burning of solid fuels, wood and mixed wastes (8%).

According to the E-PRTR data for 2009 (published 05/2011), the major release to air stem from the metal industry and chemical industry with a minor impact from power production from coal. The largest individual release to air stems from two metal facilities with reported PeCB releases of 107 kg and 240 kg respectively (E-PRTR 2009)¹¹⁰. Almost all PeCB release to water in E-PRTR (2009) of 640 kg is reported from the production of basic organic chemicals. From the E-PRTR information it could not be decided whether this release stem from current production or from deposits of the site. However, the associated water release of 88 kg of HCH from the same site indicate that larger releases stem from deposits and thus most probably the PeCB releases also stem from deposits. It is known that organochlorine production of certain solvents (tetrachlorometane, tetrachloroethene and trichloroethene) have generated and often deposited 10.000ds of tons of HCB/PeCB waste (UNEP 2010)¹¹¹. The E-PRTR data shows that these solvents are also being released from the same factory, which further supports the hypotheses that the reported case is a release of PeCB from a HCB/PeCB deposit from former tetrachlorometane, tetrachloroethene and trichloroethene production. The importance to inventory and to assess HCB/PeCB waste deposits was emphasised in the POPs inventory session at Dioxin 2011 in Bruessels (Weber et al. 2011b)¹¹². These releases constitute most of the EU PRTR 2009 water releases and more than 50% of total PRTR 2009 PeCB releases. Furthermore, a recent review on the future relevance of POPs deposits highlighted the necessity to assess the impact of flooding risks of such sites

¹⁰⁹ If waste incinerators and coal boilers would have the estimated emission of ESWI (2011) estimate they would have to report to PRTR. This inconsistency should be clarified.

¹¹⁰ This suggest that other similar facilities also can be expected to have releases of PeCB (and probably HCB¹¹⁰) considerably above 1 kg/year which would mean that for all these facilities PeCB should have been reported in the PRTR. One reason for these inconsistencies could possibly be the lack of measurements of PeCB and HCB in IPPC facilities due to the lack of legal requirements for PeCB and HCB measurements.

¹¹¹ Stockholm Convention (2010) Information document for the 6th POP Reviewing Committee meeting (UNEP/POPs/POPRC/6/INF/21).

¹¹² Weber R, Watson A, Malkov M, Costner P, Vijgen J (2011) Unintentionally produced hexachlorobenzene and pentachlorobenzene POPs waste from solvent production – the need to establish emission factors and inventories. *Organohalogen Compounds* 73.

in particular in the context of increased flooding in recent years and in future occurring in Europe triggered by climate change (Weber et al. 2011)¹¹³.

This is also underpinned by a case from Czech Republic where the releases of HCB and PeCB have and are contaminating the river Elbe sediments (Heinisch et al. 2006)¹¹⁴. For this site the releases have not been included yet in the PRTR system. The possible high impact of PeCB release from organochlorine production and deposits (in particular specific solvents) was also highlighted by a recent POP Reviewing Committee Document (UNEP 2010)

3.2.6. *SCCPs – short chain chlorinated paraffins*

Short chain chlorinated paraffins (SCCPs) are already regulated in the EU since 2002 by a restriction of the use of SCCPs for metal working fluids and fat liquoring as substances or as constituents of other substances or preparations in concentrations higher than 1%.¹¹⁵ This restriction was taken up in REACH Annex XVII. Furthermore, SCCPs (Alkanes, C10-13, chloro) were included in the candidate list for REACH Annex XIV because of their PBT and vPvB properties. Following the inclusion of SCCPs in the POPs Protocol SCCPs was listed in Annex I¹¹⁶ of the POP regulation.

The current use of SCCPs includes application in paints, adhesives and sealants, plastics and rubber, flame retardants as well as textiles and polymeric materials (e.g. PCB substitute in gaskets). However, use and production have significantly declined since 1998 and especially after 2002 due to the above mentioned EU restriction.

The rubber industry (conveyor belt, gaskets, hoses) is the main application of SCCP (1,254 t/y) followed by the sealants and adhesives sector (459 t/y) and by the paints and varnishes sector (337 t/y). The textile industry covers only a small fraction of the overall used amount of SCCP (31 t/y).

The relevant waste flows have been established for all of the sections and the corresponding figure represents that the highest share of non-hazardous waste comes from landfilling (66%) followed by incineration with about 20%.

Also leather which has been impregnated with SCCP in the past can enter the waste stream due to its long lifetime.

The total SCCP containing waste amount (without sewage sludge) sums up to about 44 kt/y.

The relative distribution of environmental emissions from investigated sectors in the EU is as follows: The most important source of emissions is volatile and particulate releases from sealants and adhesives (42 % or 36 t/y) followed by rubber (31 % or 25 t/y) as well as from paints and varnishes (21 % or 17.4 t/y) and textiles (5% or 4.1 t/y) (ESWI 2011).

3.2.7. *HCBD – hexachlorobutadien*

HCBD is listed as priority hazardous substance in the Water Framework Directive, for which discharge, emission or loss must cease or be phased out. Nevertheless, the inclusion of

¹¹⁵ Directive 2002/45/EC of the European Parliament and of the Council of 25 June 2002 amending for the twentieth time Council Directive 76/769/EEC relating to restrictions on the marketing and use of certain dangerous substances and preparations (short-chain chlorinated paraffins)

¹¹⁶ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2012:159:0001:0004:en:PDF>

HCBD in the POPs Protocol has triggered the obligation to take up HCBD in the POP regulation which is however still to be implemented.

The intentional use and production of HCBD has not occurred in Europe for many years (UNECE 2007). HCBD is mainly formed as an unintentional by-product during several industrial processes (as a solvent for rubber and other polymers, in heat transfer fluids, as a transformer liquid or hydraulic fluid). However available information about these industrial processes is scarce.

Nowadays, the most important source of HCBD is due to the manufacture of chlorinated solvents through chlorolysis of tri- and tetrachloroethene, tetrachloroethylene and tetrachloromethane. The estimated amount of HCBD produced during this process varies between ~0.7 kg/year up to possible ~500 kg/year (ESWI 2011).

Urban waste-water treatment plants are a second main source of HCBD (E-PRTR 2009). HCBD in waste water treatment stations accumulate in the sewage sludge. A total amount of HCBD which ends up in the sewage sludge in all 27 EU Member States is estimated to be approximately 6 kg/year. It must be noted here that this estimation is based on sewage sludge contamination data from China since no data from European facilities were identified (ESWI 2011).

Unintentional production and releases from the plastic (PVC) industry may be relevant, but specific data is not available yet.

HCBD is and has been produced as by-product of certain chlorinated solvent production and is among the prime pollutants of “Hexachlorobenzene” wastes deposited in 10000 tons scale from such productions in the past. Therefore such waste deposits can be considered to be the largest stock of HCBD (ESWI 2011).

3.2.8. PCN – polychlorinated naphthalenes

PCN was restricted in 2012¹¹⁷ when the POPs regulation was amended to implement the e.g. UNECE decision. However, wastes containing PCN are characterised as hazardous waste under Annex VIII entry A3180 of the Basel Convention. As PCN has been listed as a POP in the POPs Protocol, the POP Regulation will be amended adding PCN to its annexes.

PCNs are a group of substances based on the naphthalene ring system and they are structurally similar to the PCBs. PCNs are no longer commercially produced in the EU. They were produced in the past as mixtures of several congeners and with different product names e.g. Halowax, Nibren Waxes, Seekay Waxes and Cerifal Materials (UNECE 2007)¹¹⁸. The main use of PCNs was in the electrical industry as separators in storage batteries, capacitor impregnates, as binders for electrical grade ceramics and sintered metals, and in cable covering compositions. They have also been used for impregnation of wood, paper and textiles to attain water proofness, flame resistance and protection against insects, moulds and

¹¹⁸ UNECE (2007): Exploration of management options for Polychlorinated Naphthalenes (PCN) Paper for the 6th meeting of the UNECE CLRTAP Task Force on Persistent Organic Pollutants, Vienna, 4-6 June 2007.
<http://www.unece.org/env/lrtap/TaskForce/popsxg/2007/6thmeeting/Exploration%20of%20management%20options%20for%20PCN%20final.doc.pdf>

fungi. Furthermore, they were used as additives in gear and cutting oils, in lacquers and underwater paints and as raw material for dyes¹¹⁹.

PCN are currently formed mainly unintentionally during various thermal processes (UNECE 2007). As PCNs exhibit similar formation properties as PCDD/Fs, unintentional production during incineration processes as municipal solid waste incineration (MSWI), hospital waste incineration, domestic burning, or different metal processing steps such as secondary copper production, secondary aluminium production, magnesium production as well as iron sintering and electrical arc furnace processes for iron production are of relevance. Moreover, the accumulation in sewage sludge from diffuse sources is a relevant pathway (ESWI 2011).

The total waste amount is estimated about 3.200 kg of PCN (ESWI 2011). The main waste stream found its way into the recycling and recovery channel (about 90%). Emissions of polychlorinated naphthalenes to the environment amount to approximately 12 kg/year.

3.2.9. Overall waste related issues for new POPs

The POP Regulation has been amended in 2010 in order to reflect the inclusion of new POPs in the Stockholm Convention and the POP Protocol, and will be amended again (as indicated in the section 2.1.1) to include missing limit values in Annexes IV and V. Part of the necessary amendments relate to the setting of concentration limits for new POPs in waste in order to define whether further treatment will need to destroy or irreversibly transform the POP content in waste. In this context, the Commission launched a study to acquire the necessary scientific information in order to amend the POP Regulation with a view to setting limit values for new POPs.

The study made a proposal with regards to low and maximum POP concentration limits (LPCL and MCPL). It further suggested to eliminate POPs in articles directly upon becoming waste to prevent that the POPs would be diluted due to recycling in new products as it will be much more difficult to identify and eliminate the concerned substances at later stages when recycled products will become waste. In addition, this takes into consideration the high calorific value of the majority of concerned waste streams and their suitability for thermal treatment – including energy recovery – and adds an additional argument to prefer R1 operations¹²⁰ instead of landfilling as predominant treatment option (ESWI 2011).

Furthermore, the study concludes that “in order to improve the data background, analytical results on concentration levels in relevant waste streams should be generated in due time”. It became clear during the data gathering exercise within the framework of the study that “the data background is sometimes limited and the contamination levels in several waste flows are based on modelling and justified assumptions.” The authors also see the need to evaluate “real contamination levels in the relevant waste streams prior to lowering the concentration limits for PBDEs in new articles produced from recycled materials in Annex I¹²¹”.

3.3. Unintentional POPs

Unintentional POPs (UPOPs) releases remain an important POP source in the EU. They are more difficult to monitor and tackling their reduction and phase out is also complex, indeed impossible in the case of most thermal sources and of emissions from open burning.

¹¹⁹ Jakobsson, E.; Asplund, L. (2000): Polychlorinated Naphthalenes (PCNs), The Handbook of Environmental Chemistry Vol. 3 Part K, New Types of Persistent Halogenated Compounds, Chapter 5, 2000.

¹²⁰ R1 waste treatment operations = use of waste as fuel

¹²¹ The concentration limits in Annex I of the POP Regulation are a transposition of the term “unintentional trace contaminants” as mentioned in the Convention.

Furthermore, the sources of unintentionally produced POPs are rather disperse and thus measures cannot be as targeted as for intentionally produced and used POPs.

Member States extensively reported monitoring data for the release of unintentionally produced POPs into the air, water and soil using three methodologies: Stockholm Convention's, E-PRTR's and EMEP's. A remarkable amount of information is available on air and water emissions, in particular from the E-PRTR and EMEP databases that are standardised, user-friendly and are readily available in electronic form for analysis. Yet, however, there have only been few cases of reported data related to the Stockholm Convention methodology.

3.3.1. Estimation and monitoring of emissions

The emissions to air, water and soil of the unintentionally produced POPs listed in Annex C of the Stockholm Convention or in Annex III of the POP Protocol (hexachlorobenzene, pentachlorobenzene, polychlorinated biphenyls, polychlorinated dibenzo-p-dioxins and dibenzofurans and polycyclic aromatic hydrocarbons) are registered in the European Pollutant Release and Transfer Register (E-PRTR). Furthermore, EMEP is monitoring and modelling UPOPs levels in air for the EMEP region and is compiling the air inventories (EMEP 2011).¹²²

The establishment of the E-PRTR database is based on the European Pollutant Release and Transfer Register Regulation (EC) No 166/2006 (see section 0). The E-PRTR database¹²³ contains reported data from approximately 28.500 facilities from the EU-27 and Island, Liechtenstein, Norway, Serbia and Switzerland in 65 economic activities for 91 pollutants, including the unintentional produced POPs that are covered under the Stockholm Convention and the POP Protocol from 2007 to 2009 (see Table 7).

Table 7 Emissions of unintentionally produced POPs according to E-PRTR (PCDD + PCDF as TEQ)

POP substance	Year	Air	Water	Soil
Polychlorinated dibenzo-p-dioxins (PCDD) and Polychlorinated dibenzofurans (PCDF)	2007	1,22 kg	12,3 g	213 g
	2008	1,72 kg	23,4 g	2,0 g
	2009	1,35 kg	14,3 g	No data available
Main sources		Production and processing of metals	Production and processing of metals	Production and processing of metals
Hexachlorobenzene (HCB)	2007	86 kg	120 kg	No data available
	2008	259 kg	93 kg	No data available
	2009	42,3 kg	63,9 kg	No data available
Main sources		Chemical industry waste and wastewater management	Waste and wastewater management	-
Pentachlorobenzene	2007	-	16,5 kg	No data available
	2008	1,78 t	36,1 kg	No data available
	2009	348 kg	661 kg	No data available
Main sources		Production and processing of metals	Chemical Industry, Waste and waste water management, Energy sector	-

¹²³ <http://prtr.ec.europa.eu/pgAbout.aspx>

POP substance	Year	Air	Water	Soil
Polychlorinated Biphenyls (PCBs)	2007	192 kg	37,3 kg	26,4 kg
	2008	160 kg	185 kg	29,5 kg
	2009	111 kg	222 kg	516 kg
Main sources		Production and processing of metals, mineral industry	Waste and waste water management (urban waste-water treatment plants)	Waste and waste water management, Animal and vegetable products from the food and beverage sector
Polycyclic aromatic carbons (PAHs)	2007	249 t	12,7 t	343 kg
	2008	214 t	10,6 t	17,4 kg
	2009	85,7 t	7,30 t	163 kg
Main sources		Production and processing of metals	Production and processing of metals	Waste and waste water management, production and processing of metals

E-PRTR data are not suitable for establishing trends since reporting data can vary between different years depending on which plants report, and are rather incomplete at least for several UPOPs. This can be seen e.g. for PeCB with just 8 facilities reporting or for HCB where just 6 facilities reported.

Also, large variations are observed if e.g. a facility with significant emissions reports for the first time in a given year. This was the case for the high release of PeCB to water of 640 kg PeCB from a single chemical plant newly listed in 2009 (see section 3.2.5 above). Also for PCB, the 1.700% increase to soil was attributed to one facility (category 5f urban waste water treatment); reporting 483 kg PCB release to soil. This facility did not report in 2008 and without the reporting of this facility the levels of 2008 and 2009 would have been comparable.

The two selected examples show that interpretation of time trends with PRTR are currently difficult and need a detailed assessment of reporting facilities.

A more detailed investigation of some E-PRTR also reveals inconsistencies as those mentioned for PeCB emissions from some metal industries amounting to 100 and 200 kg PeCB (PRTR 2009), while other facility did not report any PeCB emissions at all (which would mean less than 1 kg release/ year).

Such inconsistencies and incompleteness in the E-PRTR in respect to UPOPs reporting will need to be systematically assessed and improved. The case of releases from the chemical factory (Table 8) highlights the need to assess also releases from POPs/UPOPs deposits in order to improve the completeness of E-PRTR data.

According to the official and unofficial emission data considered by EMEP, total emissions of PCDD/Fs within the EMEP domain decreased by 58% in the period from 1990 to 2009. PCDD/F emissions within the Northern Hemisphere (EMEP region, the USA and Canada) declined by 50% during the same period (Figure 7). Among the countries that have submitted official data on PCDD/F emissions for 2009, maximum emission reduction within the considered period took place in the Netherlands (96%), France (95%), Germany (92%), Belgium (91%), Switzerland (91%), Romania (91%) and the Czech Republic (89%).

As regards the emission data it should be noted that despite the improvements achieved in the past years uncertainties in the emission estimations remain to be relatively high, particularly in relation to emission factors and activity rates. In addition, the comparison of measured and

modelled data for dioxins and hexachlorobenzene revealed that modelled data underestimated measured air concentrations by a factor of 5 and more (EMEP 2011). According to EMEP, the underestimation can be related to the incompleteness of available emission data, underestimation of the role of secondary emission sources, differences in congener profiles and general underestimation of emissions. Thorough analysis of contemporary and historical emissions is thus needed to refine the assessments of pollution levels.

The exposure of the population to unintentional POPs is addressed by the food and feed regulations (see section 0) and by the Directive 2004/107/EC on ambient air pollutants (see section 0).

3.3.2. *Addressing industrial sources*

The core instrument covering the environmental performance of large industrial installations (covering emissions to air, water and land and generation of waste) is the Industrial Emissions Directive 2010/75/EU (IED). The emission limit values, parameters or equivalent technical measures to be set in the permits of the installations covered have to be based on the Best Available Techniques (BAT). The BAT are described and defined at EU level in the Best Available Techniques REFerence Documents (BREFs documents) which can be downloaded from the website of the European IPPC Bureau¹²⁴. The BAT conclusions from these BREFs are adopted by the Commission under the IED.

In the area of POPs, relevant BAT conclusions recently adopted include those for iron and steel, and cement, lime and magnesium oxide production.

Other relevant sectors, for which BREFs have been adopted previously under the IPPC Directive include ferrous and non-ferrous metals, paper and pulp production, waste incineration, smitheries and foundries and large combustion plants. As for the status of these documents:

The review of these BREFs is undertaken or will start in the near future in the context of the IED (2010/75/EU) (see 2.1.4).

The BAT conclusions are to be the reference for the permitting authorities in setting conditions for installations covered by the IED. In this context, emission limit values have to be set by the competent authorities for all relevant pollutants that can be emitted from the installations. The technical working groups involved in the information exchange leading to the drafting or revision of the BREFs and the Commission co-ordinating the process will for each of the sectors concerned assess which pollutants are to be dealt with in the BREF and BAT conclusions contained therein and will endeavour to exchange information on the techniques to prevent or reduce emissions of those pollutants, including their performance and costs. However, the information exchange is a voluntary process, so it will depend on the information that is provided by the stakeholders or can be gathered by the European IPPC Bureau. It may not always be the case that all 'relevant' pollutants in the context of an individually permitted installation will be covered by the BREFs and it will be for the competent authorities concerned to determine the additional pollutants for which an emission limit value may need to be set at the installation level.

The Directive 2000/76/EC on the incineration of waste covers all waste incineration and co-incineration facilities and sets limit values for emissions of PCDD/F to air (0.1 ng I-TEQ/m³)

¹²⁴ <http://eippcb.jrc.ec.europa.eu/>

and water (0.3 ng/l). This Directive is now replaced by the IED, which has taken over these limits. The Waste Incineration directive will be repealed on 7 January 2014.

In 2010, CEN has adopted part 4 of the standard EN 1948 for the determination of the mass concentration of PCDDs/PCDFs and dioxin-like PCBs from stationary source emissions (covering sampling and analysis of dioxin-like PCBs).

Combustion plants (other than those incinerating waste) with a rated thermal input of less than 50 MW are not covered by the IED. However, the IED includes a review clause in Article 73(2) according to which the Commission has reviewed the need to control emissions from these installations and has reported to the European Parliament and the Council. This report does not consider in details the emissions of POPs.

3.3.3. Addressing domestic sources

Domestic sources are also important for the release of unintentional POPs. The Commission has issued a study on “Information Exchange on Reduction of Dioxin Emissions from Domestic Sources”¹²⁵. The key messages regarding labelling were: “Eco-labelling schemes for solid fuel fired domestic appliances are established or planned in 10 Member States. The focus is on energy efficiency, low CO and dust (PM) emissions. Effects on dioxin are only indirect (reduced fuel consumption via increased energy efficiency).” The Commission published the results of the study in a brochure in order “to stimulate awareness raising, exchange of good practice as well as to encourage development of new solutions and measures”¹²⁶.

In this respect, currently under the EuP Directive a preparatory study on “Solid Fuel Small Combustion Installations” (Lot 15) has been undertaken. The study concluded that no measures with regards dioxins will be taken.

Recently it has been described (Grochowalsky (2010)) that use of copper catalysts that are marketed in some European countries for cleaning domestic ovens increases the dioxin emission from a domestic source by several orders of magnitude. Even assuming that only a small percent of the population would use such a catalyst, the release from this already relevant source could considerably increase. Therefore, the desirability of such practice might need to be examined.

3.4. Information on the state of knowledge on stockpiles and contaminated sites

Since the production of most POPs ended some years ago, only a minor part is still in use in the anthroposphere. However, exposure of humans and the environment can continue from landfills, dumps, stockpiles or contaminated sites where a large part of POPs has been deposited or stored (Weber et al. 2008¹²⁷, Weber et al. 2011¹²⁸). Therefore the identification

and assessment of POPs contaminated sites and deposits and their current impact is a crucial part of assessing POPs exposure risk and management needs.

The European Environmental Agency estimated that potentially polluting activities have occurred at nearly 3 million sites and stressed that investigation is needed to establish, whether remediation is required (European Environment Agency 2007). In this overview report it was however not mentioned how many of these sites have POPs as a main contaminant.

Monitoring under the Water Framework Directive, particularly if done in biota and/or sediment, should increasingly contribute to knowledge of the contamination of water bodies with several of the POPs and thus support the targeting of remediation.

3.4.1. PCB contaminated sites and deposits

In several European rivers, the maximum level set for dioxin-like PCBs in food¹²⁹ was found to have exceeded in fish (e.g. BUWAL 2010¹³⁰, NIP Germany¹³¹). In a recent study in Switzerland – considering this European maximum levels for dioxin-like PCBs – such fish contamination could be tracked back to PCB point sources (e.g. landfill containing condensers or metal smelting industry having used and/or processed PCB containing equipment) (Zennegg et al. 2010)¹³². Due to the experiences with PCB contaminated sites and their impact on fish in surface waters the Swiss environmental agency (BUWAL) is currently establishing a manual for competent authorities to track potentially PCB contaminated sites (Trempe 2011)¹³³. No similar mapping approach to track directly the point sources for PCB contamination has been discovered in the assessment of NIPs of EU Member States and other EU agency reports. The only other example identified is a comprehensive mapping of PCB contaminated sites established for France by a NGO¹³⁴.

3.4.2. HCH contaminated sites and waste deposits

Waste deposits of HCH in the EU originate mainly from the former production of lindane, which is a γ -isomer of HCH. According to several studies by International HCH & Pesticides Association (IHPA 2006 a,b, Vijgen et al. 2011)^{135,136,137}, 300000 t of lindane have been used within the EU between 1950 and 2000 which resulted to generation of 1.8 to 3 million tonnes of HCH wastes that were largely deposited around the production sites.

The IHPA 2006 a,b studies report two main European cases on HCH in the Netherlands and Spain (Basque country). These cases have proven that often the original waste problem has

¹³⁷ Vijgen et al. (2011). HCH as new Stockholm Convention POPs – a global perspective on the management of Lindane and its waste isomers. *Env Sci Pollut Res.* 18, 152-162

additionally resulted in a huge soil problem. For example, the original amount of 5500 tons of HCH waste in the Netherlands has created a regional soil contamination of nearly 400 000 m³. Similar experiences can be stated from Basque Country where nearly 90000 tons of HCH waste has led to a soil pollution of 500.000 to 1 Mio tons of with HCH contaminated soils.

A recent review on global perspective on the management of lindane and its waste isomers (Vijgen et al. 2011) identifies the following EU Member States with former lindane production: Austria, Czech Republic, France, Germany, Hungary, Poland, Romania, Slovakia, Spain, The Netherlands, UK. Additionally in Europe Macedonia and Switzerland have produced lindane.

3.4.3. *Other POPs Pesticides*

Sites contaminated with POP pesticides are particularly a challenge in East European countries and are associated with POP-pesticide stockpiles and former sites where POP pesticides have been stored. These sites pose critical exposure risk for local population (IHPA 2011)¹³⁸ and can contribute to contamination of food in EU.

3.4.4. *Contaminated sites from unintentionally formed POPs (PCDD, PCDF, PCB, HCB, PeCB, PAHs)*

At country level Sweden has comprehensively assessed PCDD/PCDF contaminated sites and started with remediation and securing activities.

In respect to PeCB and HCB, a recent UNEP report from the POP Reviewing Committee also highlights the relevance of deposited HCB/PeCB wastes from organochlorine productions which amounted to 10,000 tonnes for individual factories (UNEP 2010). Within the EU, only one such case has been documented, including the resulting releases to water (Heinisch et al. 2006)¹³⁹. Moreover, the largest known emission level of PeCB in water (640 kg; PRTR 2009) is more likely to be attributed to a release from a contaminated site/deposit than to production itself.

Further relevant contaminated sites concern the former disposal of residues from chloralkali plants highly contaminated with PCDD/F, PCN, PAH and Barium. One case revealed the significance of such contaminations¹⁴⁰. This case was subsequently remediated¹⁴¹.

3.4.5. *PBDE contaminated sites*

PBDEs contaminated sites or hot spots have mainly been reported from primitive treatment of electronic waste (Wong et al. 2007)¹⁴² and from the release of PBDE from landfills (Weber et al. 2011) 143. The assessed landfills were located in the US, Canada, Japan and South Africa. PBDE have been detected in the leachates or ground water in all the landfills under

investigation. There are also studies that have been made in European countries and in which PBDE has been analysed in landfill leachates (COHIBA 2011)¹⁴⁴.

For PBDE production sites or areas where PBDE have been used, e.g. in the plastic industry, no reports on contaminated sites have been found in the public domain. A systematic assessment of environmental contamination in the life cycle of PBDE is missing in this respect.

3.4.6. PFOS contaminated sites

The landfilling of waste originating from the production and use of PFOS and other perfluorinated compounds has generated large contaminated sites (Bantz 2011¹⁴⁵, Kroefges et al. 2007¹⁴⁶, Oliaei et al. 2011¹⁴⁷, Weber et al. 2011¹⁴³). Therefore, the need of a comprehensive assessment of PFOS contaminated sites along the life cycle of PFOS is reflected also in the recommendations of the COP5¹⁴⁸.

A systematic assessment on PFOS contaminated sites has not yet been reported by any of the Member States. However, some ad hoc work has started in Europe in recent years.

In one instance, drinking water was polluted for more than 4 million people (Kroefges et al. 2007). The PFOS/PFOA source was contaminated sludge imported to Germany as hazardous waste which then was relabelled by the importing company and sold to farmers which treated the agricultural fields with it thereby contaminating many areas. From there, perfluorinated compounds leached into rivers and the drinking water reservoir (Skutlarek et al. 2006).¹⁴⁹

Other PFOS contaminated sites have been described for application sites of fire fighting foams (Norwegian Pollution Control Agency¹⁵⁰, State of Jersey 2004¹⁵¹, Weber et al. 2011).

The analysis of leachate from municipal solid waste landfills in Denmark (Bossi 2008¹⁵²), Germany (Busch 2010¹⁵³) and Sweden (Woldegiorgis 2006¹⁵⁴) has revealed that leachates can contain high levels of PFCs including PFOS. An assessment of deposited wastes and related releases has not been performed up to now.

A systematic assessment on PFOS contaminated sites has been reported on the city level for Düsseldorf/Germany (Bantz et al. 2011).

In summary, these examples show that PFOS (and other perfluorinated compounds) can result in PFOS (PFC) contaminated sites and – due to their mobility – in water, too, thus impacting the wider environment. Hence, a systematic assessment of such sites is necessary.

3.5. Emerging POPs

Both international agreements on POPs foresee listing of additional substances in the annexes of substances to be banned, restricted or otherwise controlled. Any Party may propose amendments to this end, and criteria and procedure for review of the proposals have been established. The aim of the European Union and the Member States is to include further POP substances particularly under the Stockholm Convention agreement in order to contribute to achieving the 2020 chemicals target adopted at the World Summit on Sustainable Development.

The EU has submitted two-thirds of the proposals for new POPs under the Stockholm Convention (Endosulfan, Commercial Octabromodiphenyl ether; Pentachlorobenzene, short-chain chlorinated paraffins (SCCPs), Hexachlorobutadien (HCBd), Polychlorinated naphthalenes (PCNs), pentachlorophenol (PCP) and dicofol) and PFOS and trifluralin in addition under the POP Protocol . The proposal for the inclusion of short-chain chlorinated paraffins, HCBd, PCNs, PCP and dicofol under the Stockholm Convention are currently under evaluation by the POP Review Committee.

The registration of chemicals under the REACH Regulation may serve as a main source of information for identifying emerging POPs. Although there are tonnage triggers for registration below which the data submitted to the authorities are not necessarily sufficient for POP assessment, the REACH regulation addresses the specifically PBT or vPvB substances (see section 0).

The online PBT Information System of the Joint Research Centre provides information on existing substances which have been subject to evaluation of their PBT properties under the Interim Strategy for REACH and the EEC/793/93 Existing Substances Regulation (ESR) program.¹⁵⁵

¹⁵⁵ <http://esis.jrc.ec.europa.eu/index.php?PGM=pbt>

PART II – IMPLEMENTATION PLAN

4. IMPLEMENTATION OF THE BASIC OBLIGATIONS OF THE STOCKHOLM CONVENTION

4.1. Elimination of intentional production and use of POPs (Article 3(1))

4.1.1. POP pesticides, HCB, HBB and PeCB

Obligation: Article 3, paragraph 1(a)(i) of the Convention: prohibit and / or take legal or administrative measures necessary to eliminate the production and use of aldrin, alpha and beta hexachlorocyclohexane, chlordane, chlordecone, dieldrin, endosulfan, endrin, heptachlor, hexabromobiphenyl, hexachlorobenzene, lindane, mirex, pentachlorobenzene as well as toxaphene.¹⁵⁶

Implementation so far: Production, placing on the market and use of the above-mentioned substances as such, in preparations or in articles is prohibited in the EU by Regulation (EC) No 850/2004. The EU does not provide for any country-specific exemptions.

Analysis: Legal measures regarding production, placing on the market and use are considered to be sufficiently comprehensive. There is no need for further legislative measures at Union or Member State level as the Regulation is directly applicable in all EU Member States.

Border and market surveillance by the Member States remain necessary and following recent findings of HCB presence in some fireworks it is desirable to intensify compliance controls of products in line with Regulation (EC) No 765/2008 setting out the requirements for accreditation and market surveillance relating to the marketing of products. Cases of non-compliance need to be reported to the Commission.

4.1.2. PCBs

Obligation: Article 3, paragraph 1(a)(i) and Annex A, Part II of the Convention: prohibit and / or take legal or administrative measures necessary to eliminate the production and use of PCBs.

Implementation so far: Production, placing on the market and use of PCBs as such and in preparations is fully prohibited by Regulation (EC) No 850/2004.

Articles containing PCBs already in use are covered by specific provisions laid down in Directive 96/59/EC (PCB Directive) (cf. section 0). The Directive requires Member States to compile inventories of equipment with PCB volumes of more than 5 litres, and to phase-out and destroy such PCB equipment before the deadline of 31.12.2010.

Analysis: Legal measures on production, marketing and new use of PCBs (and PCTs) are sufficiently comprehensive and there is no need for further legislative measures at Union or Member State level as the Regulation is directly applicable in national legislation in each EU-Member State. Directive 96/59/EC addresses the main application areas of PCBs and lays down a stringent timetable for specific essential control actions. In conformity with the PCB Directive, inventories of PCB containing equipment, as well as action plans for their disposal and collection were compiled by all Member States. The Commission has gathered information about current amounts of PCB equipment and PCB wastes in the EU given that the information on PCB inventories had become obsolete (cf. section 3.1.4). The survey has

¹⁵⁶ Those substances that have been added to the Convention in 2009 and 2011, are underlined.

showed that there are still significant quantities of PCB equipment in use. In addition, only three Member States have achieved to decontaminate or to dispose of large PCB equipment by the end of 2010 as required by the Directive. In those cases where the deadline for the disposal and decontamination of large PCB equipment has not been met and in those cases where MS did not provide any information, the Commission will consider the need to take legal steps.

PCBs have been used in several open applications (e.g. sealants, anti-corrosion paints, flame retardants, specific paper). Open applications are highlighted by the PCB Elimination Network in the Stockholm Convention context due to the relevance of human exposure in kindergarten, schools and other public buildings but also private housing constructed in the 1950s to the early 1970s. It is desirable that Member States consider the situation of open PCB applications in their territory and take measures to minimise exposure of humans and the environment to PCBs from this source.

From the 1950s to the early 1970s, PCBs uses in anti-corrosion paints included bridges and other constructions as well as electric poles. Some of this equipment reaches the end of its useful life. The large metal parts are recycled in electric arc furnaces (EAF). Since the combustion processes in these batch operations are incomplete, a considerable share of these PCBs will most probably evaporate and not be destroyed. Furthermore, these conditions promote the development of PCDF which is associated with an increased toxicity. Currently, there is no assessment available as to how much PCB painted scrap is entering the waste stream and the secondary metal treatment. Also, there is no data on dedicated testing of associated releases. However, it is known from measurements in EAF that considerable PCB loads are emitted which only can be explained by PCB input from material treated with it¹⁵⁷.

4.1.3. *Hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether*

Obligation: Article 3, paragraph 1(a)(i) and Annex A, Part IV and Part V of the Convention: prohibit and / or take legal or administrative measures necessary to eliminate the production and use of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether. A Party may allow recycling of articles that contain or may contain hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether, and the use and final disposal of articles manufactured from recycled materials that contain or may contain hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether.

Article 3, paragraph 6: take appropriate measures to ensure that any production or use under a specific exemption in accordance with Annex A or a specific exemption or an acceptable purpose in accordance with Annex B is carried out in a manner that prevents or minimizes human exposure and release into the environment. For exempted uses or acceptable purposes that involve intentional release into the environment under conditions of normal use, such release shall be to the minimum extent necessary, taking into account any applicable standards and guidelines.

Recommendations COP5

COP5 in its decision SC-5/5 encouraged parties and other relevant stakeholders to implement the recommendations provided in the decision POPRC-6/2 on the elimination from the waste

¹⁵⁷ Also, the PCB pattern from EAF have often a congener finger print of industrial PCBs demonstrating that the main PCB release stem from the input material and are not unintentionally formed.

stream of brominated diphenyl ethers with the objective to achieve the elimination as swiftly as possible. The recommendations include:

- Separate articles containing BDEs as soon as possible before recycling¹⁵⁸; establish and apply screening techniques and separate materials containing BDEs.
- The main focus should be on developed countries handling primary flame-retarded articles containing higher concentrations of BDEs; attention should be paid to identification and treatment of BDEs in articles for both domestic use and for export.
- Begin establishing national control schemes for recycling of waste potentially containing BDEs.
- Following the implementation of effective screening and separation techniques, stop the recycling of articles containing BDEs.
- Store in a safe manner materials and articles containing BDEs when screening and separation techniques are not readily available.
- Stop the export of waste materials containing BDEs except for the purpose of environmentally sound disposal in the importing country as set forth in paragraph 1 (d) of Article 6 of the Stockholm Convention.¹⁵⁹
- Endeavour to promote the commercialization of separation techniques, which have already been evaluated in trial plants or which have yet to be developed, for removing BDEs from plastic matrices to permit continued recycling.

Implementation so far: Production, placing on the market and use of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether is prohibited fully by Regulation (EC) No 850/2004. In addition, Directive 2002/95/EC on the restriction of hazardous substances in electrical and electronic equipment (EEE) (RoHS Directive, see section 0) allows the use of all PBDEs in EEE put on the EU market only below the maximum concentration value of 0,1 weight-% in the homogeneous material and in case of specific exemptions listed in the Directive's Annex. Under the POP Regulation uses of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether that fall under the scope of the RoHS Directive are allowed as exemption as well as concentrations of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether equal to or below 10 mg/kg (0,001% by weight) when it occurs in substances, preparations, articles or as constituents of the flame-retarded parts of articles. Articles and preparations containing concentrations below 0,1% of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether by weight when produced partially or fully from recycled materials or materials from waste prepared for re-use are also exempted from the obligation. Furthermore, the POP Regulation stipulates that the use of articles already in use in the Union

¹⁵⁸ Failure to do so will inevitably result in wider human and environmental contamination and the dispersal of brominated diphenyl ethers into matrices from which recovery is not technically or economically feasible and in the loss of the long-term credibility of recycling. Time is short because articles containing brominated diphenyl ethers are already present in many existing waste streams as a result of the time frame of former production of these articles. Brominated diphenyl ethers should not be diluted since this would not reduce the overall quantity in the environment.

¹⁵⁹ That is articles for which the flame retardant content was added for the purposes of flame retardancy rather than articles which contain some flame retardant as a consequence of contaminants in recycle.

before 25 August 2010 containing hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether as a constituent of such articles shall be allowed.

Analysis: Legal measures on production, placing on the market and use of hexabromodiphenyl ether, heptabromodiphenyl ether, tetrabromodiphenyl ether and pentabromodiphenyl ether are comprehensive and there is no need for further legislative measures at Union or Member State level.

Border and market surveillance by the Member States is a necessity. Cases of non-compliance need to be reported to the Commission.

In particular PBDEs will continue to challenge the waste management sector due to the long life-span of the major product groups (e.g. vehicles, electronics), containing them and the existence of recycling schemes for these waste streams (cf. sections 3.2.2 and 3.2.3).

As stated in sections 3.2.2 and 3.2.3, the major remaining PBDE input into the economic goods cycle is via the use in products and their further input into recycling, stockpiles and the waste stream. The Commission is preparing a legislative proposal to set low and maximum PBDE concentration limits in the Annexes IV and V of the POP Regulation (cf. section 3.2.9). However, further efforts are needed at Member States level in order to ensure a reduction of PBDE input to recycling operations and with regard to exports and appropriate management and treatment of the waste stream.

A strategy and methodology needs to be developed for the identification of articles in use, in the recycling, in stockpiles and wastes that contain PBDEs. For these activities also the recommendations of the COP5 should be considered.

The Stockholm Convention has not yet set a low POPs limit and this will be done in cooperation with the Basel Convention. The establishment of European limits and related regulation could provide valuable input to these processes.

The POPs in waste report prepared for the Commission (ESWI 2011) as well as the consultancy for the POPs Reviewing Committee (UNEP 2010 a,b)¹⁶⁰ revealed that PBDEs are still contained in articles in use and in some material flows at the end of life in the EU.

C-PentaBDE (TetraBDE and PentaBDE) uses

A main material flow is cars and other transport vehicles produced from the 1970s to 2000 (and some possibly up to 2004). They are partly used and sold within the EU and partly exported to other regions. There is no database on producer and year of cars/transport vehicles containing PBDE and also no monitoring activity or scheme for this. Only limited information is available from the (former) producers of cars. Such information would be a good base in which to better understand the situation on use and reuse of these cars/transport vehicles and the export of vehicles containing PBDEs. Some Member States are doing screenings of end of life vehicles to generate necessary data, however, it would be useful to have data from several Member States to have a more comprehensive and representative overview.

¹⁶⁰ UNEP (2010) “Technical Review of the Implications of Recycling Commercial Pentabromodiphenyl Ether and Commercial Octabromodiphenyl Ether” from 6th POP Reviewing Committee meeting Geneva October 2010 (UNEP/POPs/POPRC.6/2 (a) and related Annex report UNEP/POPs/POPRC.6/INF/6 (b).

Action 1: Commission to collect available data on presence of PBDEs in vehicles and facilitate exchange of information among the Member States

C-OctaBDE (HexaBDE and HeptaBDE).

The main remaining C-OctaBDE in articles in use, export and recycling is the use as flame retardant in plastic in electronics.

PBDE/BFR-containing plastic (mainly) from WEEE is often recycled to other plastic materials by blending them with virgin polymer materials. Due to the mix of polymer types the WEEE plastic is typically down-cycled to products in applications with less material demanding properties. Screening of plastic products has revealed that even sensitive uses like children toys (Chen 2009)¹⁰⁵ along with household goods (Chen 2010)¹⁰⁶ and video tapes (Hirai 2007)¹⁶¹ are contaminated with PBDE and other BFRs. There is little information on how the flow of plastics recovered from WEEE and containing PBDE is controlled in recycling operations.

In the assessment of the POP Reviewing Committee only a few full scale e-waste recycling facilities were separating PBDE containing plastic (UNEP 2011a,b)¹⁶². One facility in Switzerland had an automatic separation step for WEEE plastic containing BFRs (halogens). Information is available from Sweden on the separation of BFR-containing plastics from WEEE plastics.¹⁶³

It would appear that not all European WEEE recycling plants have bought appropriate equipment to identify and separate PBDE (BFR) containing plastic from other plastic. It is also not known how much of the plastic generated at such plants are exported outside the EU for further recycling.

Action 2: Commission to gather available information on the separation of PBDE-containing materials in the recycling flow of WEEE in the EU and depending on the outcome consider further actions.

Action 3: Commission to gather validated measurement methods to control the export of waste plastic containing PBDE in particular electronic waste in the Member States, depending on the outcome and the quality of information take further actions

4.1.4. DDT

Obligation: Article 3, paragraph 1(b) and Annex B, Part II of the Convention: restrict the production and/or use of DDT, in accordance with the provisions of Annex B, Part II. The use of DDT as disease vector control is allowed as acceptable purpose.

¹⁶¹ Hirai, Y. Sakai, S.-i. (2007). Brominated Flame Retardants in Recycled Plastic Products. BFR2007: 4th International Symposium on Brominated Flame Retardants.

¹⁶² In the “Technical Review of the Implications of Recycling Commercial Pentabromodiphenyl Ether and Commercial Octabromodiphenyl Ether” for the 6th POP Reviewing Committee meeting Geneva October 2010 (UNEP/POPs/POPRC.6/2 (a) and UNEP/POPs/POPRC.6/INF/6 (b)), such information has been compiled including information on facilities operated.

¹⁶³ Recycling of WEEE Plastics Containing Brominated Flame Retardants- a Swedish perspective”, Recycling Development AB and Vascaia, made for the Swedish EPA,2010

Implementation so far: Production, placing on the market and use of DDT as such, in preparations or in articles is totally prohibited by Regulation (EC) No 850/2004. No exemption is granted by the Regulation.

On the basis of note (iii) of Annex B, Part I, of the Stockholm Convention, the POP Regulation initially granted an exemption for Spain to continue the existing manufacture of dicofol using DDT as site-limited, closed-system intermediate until 2014. The exemption of use of DDT in dicofol production was withdrawn from the POP Regulation in 2010. The Commission decided on the non-inclusion of dicofol in Annex I to Council Directive 91/414/EEC and on the withdrawal of authorisations for plant protection products containing that substance (2008/764/EC)¹⁶⁴ in 2008. According to the Commission Decision, all existing authorizations for dicofol in plant protection products had to be withdrawn before 30 March 2009. National registration of dicofol was not possible after March 2009. Any transition period granted by Member States should end by 30 March 2010 at the latest (cf. section 3.1.1).

Analysis: Legal measures are considered comprehensive. There is no need for further legislative measures at Union or Member State level as the Regulation is directly applicable in all EU Member States.

4.1.5. *Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride (PFOS)*

Obligation: Article 3, paragraph 1(b) and Annex B, Part III of the Convention: restrict the production and/or use of perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride, in accordance with the provisions of Annex B, Part III. For registered parties, numerous acceptable purposes and specific exemptions are granted for the production and/or use.

Article 3, paragraph 6: take appropriate measures to ensure that any production or use under a specific exemption in accordance with Annex A or a specific exemption or an acceptable purpose in accordance with Annex B is carried out in a manner that prevents or minimizes human exposure and release into the environment. For exempted uses or acceptable purposes that involve intentional release into the environment under conditions of normal use, such release shall be to the minimum extent necessary, taking into account any applicable standards and guidelines.

Implementation so far: Production, placing on the market and use of perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride as such, in preparations or in articles is severely restricted by the Regulation (EC) No 850/2004. On the basis of acceptable purposes and specific and general exemptions granted by the Convention, the Regulation provides for the following exemptions:

- placing on the market and use is allowed in concentrations of PFOS equal to or below 10 mg/kg (0,001 % by weight) when it occurs in substances or in preparations;
- concentrations of PFOS in semi-finished products or articles, or parts thereof is allowed, if the concentration of PFOS is lower than 0,1 % by weight calculated with reference to the mass of structurally or micro-structurally distinct parts that contain PFOS or, for textiles or other coated materials, if the amount of PFOS is lower than 1 µg/m² of the coated material;

¹⁶⁴

<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2008:262:0040:0041:EN:PDF>

- use of articles already in use in the Union before 25 August 2010 containing PFOS as a constituent of such articles is allowed;
- if the quantity released into the environment is minimised, production and placing on the market is allowed for the following specific uses provided that Member States report to the Commission every four years on progress made to eliminate PFOS:
 - until 26 August 2015, wetting agents for use in controlled electroplating systems
 - photoresists or anti reflective coatings for photolithography processes;
 - photographic coatings applied to films, papers, or printing plates;
 - mist suppressants for non-decorative hard chromium (VI) plating in closed loop systems;
 - hydraulic fluids for aviation;

Concerning fire-fighting foams that were placed on the market before 27 December 2006 they may be used only until 27 June 2011. Some stocks remain in the EU but are in the process of disposal (cf. section 3.2.4)

Annex I, Part A of the Regulation also provides that as soon as new information on details of uses and safer alternative substances or technologies for the specific uses becomes available, the Commission shall review the derogations in the second subparagraph so that:

- the uses of PFOS will be phased out as soon as the use of safer alternatives is technically and economically feasible,
- a derogation can only be continued for essential uses for which safer alternatives do not exist and where the efforts undertaken to find safer alternatives have been reported on,
- releases of PFOS into the environment have been minimised by applying best available techniques.

There is no production of perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride in the EU. However, the substance is still placed on the market and used for allowed applications as listed above (cf. section 3.2.4).

Analysis

Challenges in substitution remains for PFOS application for which exemptions were granted in the POP Regulation. Support of the development and phasing in of alternatives is therefore desirable.

The use of PFOS in the metal plating industry is the main remaining source for PFOS releases from an intended purpose. Alternatives and substitutes have already been investigated for this use but there is a lack of practical implementation (cf. section 3.2.4). With a view to phase-out the use of PFOS in this area within the EU, support of practical implementation projects to help mostly concerned SMEs in phasing in alternative processes to PFOS might be desirable.

The collection of information for BAT/BEP for PFOS use in industrial processes under the Convention has just been initiated. It is desirable that Member States gather information and

document BAT/BEP for the listed exemptions and forward the information to the Stockholm Convention Secretariat for consideration in the Stockholm Convention process.

The Stockholm Convention has a dedicated process for collecting information on PFOS alternatives and the first report has been developed for the POPs Reviewing Committee¹⁶⁵. An important complementary process would be an in depth assessment of these alternatives for an optimized choice of alternatives taking into account risk for human health and ecotoxicity criteria. Within REACH a wide range of information will be generated for chemicals also including a range of PFOS substitutes.

Action 4: Commission to compile information on PFOS alternatives from the REACH process and feed this information into the Stockholm Convention process on alternatives to PFOS to guide the selection process of PFOS alternatives for the different application areas.

PFOS is present in broad range of articles at relatively low concentrations. Measurement of concentration of PFOS and its precursors in articles at low levels is the major challenge of compliance and border controls. The Commission has mandated the work of European Committee for Standardization (CEN) to develop a standard analytical method for determination of PFOS in articles. Technical specification CEN/TS 15968 titled 'Determination of extractable PFOS in coated and impregnated solid articles, liquids and fire-fighting foams – Method for sampling, extraction and analysis by LC-qMS or LC-tandem/MS' was adopted by the CEN in 2010. In order to develop a fully standardized method, there is a need to perform a validation of the measurement method described in the technical specification.

Action 5: Commission to support the validation of a CEN standard on measurement of PFOS in coated and impregnated solid articles, liquids and fire-fighting foams.

For PFOS no exemptions for recycling of PFOS containing articles have been granted. Therefore recycling of PFOS containing materials is not allowed. Commission contracted a study (ESWI 2011) to gather information on the status of recycling flows possibly including PFOS containing materials. The study showed that recycling activities of some potentially PFOS containing materials are taking place but the concentration of PFOS is low. Probably the most relevant recycling activity in this respect is the recycling of synthetic carpets potentially contaminated with PFOS or PFOS precursors¹⁶⁶. Other materials potentially contaminated with PFOS or PFOS precursors are e.g. textiles, paper or aviation fluid.

¹⁶⁵ <http://chm.pops.int/Convention/POPsReviewCommittee/hrPOPRCMeetings/POPRC5/POPRC5Followupcommunications/PFOSalternativesguidanceInvitationforcomments/tabid/741/language/en-US/Default.aspx>

¹⁶⁶ See for example <http://www.carpetrecyclinguk.com>

4.2. Elimination of import and export of POPs (Article 3(2))

Obligation: Article 3, paragraph 1(a)(ii) of the Convention: prohibit and / or take legal or administrative measures necessary to eliminate the import and export of the chemicals listed in Annex A. Article 3, paragraph 2 of the Convention: take measures regarding the import and export of chemicals in Annex A or Annex B.

Implementation so far: Import is regarded as placing on the market in the EU and thus import of all Annex A and B chemicals is prohibited by Regulation (EC) No 850/2004 except for the following exemptions:

- A substance used for laboratory-scale research or as a reference standard;
- A substance occurring as an unintentional trace contaminant in substances, preparations or articles;
- A substance as such or as part of articles for the purpose of environmentally sound disposal;
- A substance as such or as part of articles for a use or purpose which is permitted by the Regulation (EC) No 850/2004, i.e. PFOS for exempted uses.

Export of all Annex A and B chemicals except for PFOS and Endosulfan (cf. section 0) is explicitly prohibited by Regulation (EU) No 649/2012, except for chemicals in quantities not likely to affect health or the environment, and in any event not more than 10 kg, provided that they are imported or exported for the purpose of research or analysis. The export of PFOS and Endosulfan is currently possible, but only on condition that the importing country consents to the import of the chemicals under the framework of the Rotterdam Convention.

Analysis: The existing legal measures on import and export cover the obligations laid down in the Stockholm Convention. The above mentioned regulations are directly applicable legislation in all EU-Member States.

To enforce the legislation, effective border control by Member States is a necessity. This may benefit from individual tariff codes for the listed POP chemicals.

Action 6: Commission to investigate the possibility to initiate international work on development of individual tariff codes for POP substance¹⁶⁷.

In 2011 Endosulfan was added to the Annex A of the Convention and the legal act implementing total ban of its production, placing on the market and use came into force in July 2012. The ban on the export of endosulfan under Regulation (EU) 649/2012 was introduced on 25th of January¹⁶⁸ 2013 and applies from 1 April 2013.

4.3. Prevention of the production and use of new chemicals exhibiting characteristics of POPs (Article 3(3))

Obligation: Article 3(3): Take measures to regulate with the aim of preventing the production and use of new chemicals and pesticides which, taking into consideration criteria

¹⁶⁷ This action had already been part of the ECIP issued in 2007 and has not yet been achieved. It is hence taken over as an action into the current implementation plan.

¹⁶⁸ Commission Regulation (EU) No 73/2013 of 25 January 2013 amending Annexes I and V to Regulation (EC) No 689/2008 of the European Parliament and of the Council concerning the export and import of dangerous chemicals

in paragraph 1 of Annex D of the Stockholm Convention, exhibit the characteristics of persistent organic pollutants.

Implementation so far: Article 3(3) of Regulation (EC) No 850/2004 repeats the provision of the Stockholm Convention but the practical implementation is left to be done in the framework of the existing Union regulatory and assessment schemes for chemicals, plant protection products and biocides. The REACH Regulation (1907/2006/EC; EU regulatory framework for chemicals) (cf. section 0), Regulation 1107/2009 (plant protection products) (cf. section 0) and Regulation 528/2012 (biocidal products) (cf. section 0) are in this regard of particular importance.

Analysis: Production and placing on the market of POP like substances can in principle be effectively prevented within the existing regulatory frameworks for chemicals (cf. section 0). Although there are tonnage triggers for registration below which the data submitted to the authorities will not necessarily be sufficient for POP assessment in the framework of the REACH Regulation, it addresses specifically substances of very high concern with PBT criteria through its system of authorisation that does not have any tonnage trigger. Furthermore, the European Chemicals Agency has a right to request further information from companies if it suspects that a substance might exhibit POP characteristics (cf. section 0).

Regulation (EC) No 1107/2009¹⁶⁹ concerning the placing of plant protection products on the market (PPP Regulation) prevents chemicals exhibiting POP characteristics from being used in plant protection products. This is achieved by the provisions according to which an active substance, safener or synergist shall only be approved for use in plant protection products where it is not considered to be a POP or if it is not considered to be a persistent, bioaccumulative and toxic (PBT) substance or a very persistent and very bioaccumulative substance (vPvB). In addition, a substance shall be approved as a candidate for substitution if it meets two of the PBT criteria.

Regulation (EC) No 528/2012¹⁷⁰ concerning the making available on the market and use of biocidal products prevents chemicals exhibiting POP characteristics from being used in biocidal products. This is achieved by the provisions according to which an active substance cannot be authorised if it meets the criteria for being persistent, bioaccumulative and toxic or very persistent and very bioaccumulative according to Annex XIII to REACH Regulation. In addition, a substance shall be approved as a candidate for substitution if it meets two of the PBT criteria.

Proper enforcement of the obligation will require concerted action by the industry, rapporteur Member States, other Member States, the Commission and the European regulatory Agencies involved in the risk assessment of chemicals.

Action 7: Commission and Member States to ensure that the POP assessment is properly incorporated in the assessment of chemicals subject to different legislative provisions within the EU (in general as continuous task).

¹⁶⁹ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2009:309:0001:0050:EN:PDF>
¹⁷⁰ <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2012:167:0001:0123:EN:PDF>

4.4. Assessing and controlling chemicals in use (Article 3(4))

Obligation: Article 3(4): Take into consideration within assessment schemes for pesticides and chemicals in use, the criteria in paragraph 1 of Annex D when conducting assessments of pesticides and chemicals.

Implementation so far: Article 3(3) of Regulation (EC) No 850/2004 not only repeats but strengthens the provision of the Stockholm Convention: It requires the Commission and the Member States to take “appropriate control measures” on existing chemicals and pesticides exhibiting POP characteristics. As in the case of new chemicals (see 0), the practical implementation is left to be done in the framework of the existing Union regulatory and assessment schemes for industrial chemicals, plant protection products and biocides.

Analysis: From the Stockholm Convention’s legal implementation point of view, the legislative measures taken by the Union can be regarded as fully sufficient.

The distinction of new and existing substances is not anymore regarded as fully justified within the Union. This change is reflected in the REACH Regulation and will be reflected also in the regulatory frameworks set up for plant protection products and biocides when the extensive review programmes on the existing active substances have been accomplished.

4.5. General exemptions

Obligation: Article 3(5): Not to apply prohibitions and restrictions to quantities of a chemical to be used for laboratory-scale research or as a reference standard. Notes (i)-(ii) of Annexes A and B: Quantities of a chemical occurring as unintentional trace contaminant in products and articles or occurring as constituents of articles manufactured or already in use before or on the date of entry into force of the relevant obligation are exempted from the prohibitions / restrictions.

Implementation so far: Article 4(1) and (2) of Regulation (EC) No 850/2004 lay down the general exemptions. Member States are obliged to notify all articles containing any of the listed substances as constituents to the Commission, who in turn will notify the Secretariat in line with note (ii) of Annexes A and B. So far no such articles have been identified by the Member States.

The term of “unintentional trace contaminants” as mentioned in the Convention’s Annex A note (i) and Annex B note (i) is a challenge for the enforcement, particularly if a chemical is used in articles. Therefore other environmental and chemical legislation in the EU does not use such term but they rather refers to concrete maximum concentration values (e.g. the RoHS Directive). The aim of these fixed thresholds is to facilitate uniform enforcement and control and provides legal certainty to economic operators. Therefore, the POP Regulation for the newly listed POPs with use in articles will contain fixed concentration values below which substance is considered to be an "unintentional trace contaminant" (see sections 0 and 3.2.9).

Analysis: The legal actions are sufficient and no further legal measures are needed. Border and market surveillance by the Member States is necessary and cases of non-compliance need to be reported to the Commission.

4.6. Reduction of total releases from unintentional production (Article 5)

Obligation: Article 5: To reduce the total releases of the chemicals listed in Annex C (PCDDs, PCDFs, PCBs, HCB and PeCB) with the goal of continuing their minimisation and, where feasible, achieving their elimination; To develop an action plan to identify, characterise and address the releases of by-product POPs; To promote the application of available, feasible and practical measures to achieve a reasonable level of release reduction or source elimination and to promote the development and require the use of materials, products and processes to prevent the formation and release of chemicals listed in Annex C; To promote and require the use of best available techniques (BAT) and best environmental practices (BEP) to prevent the release of chemicals listed in Annex C for new sources in main source categories; To promote the use of BAT and BEP for existing sources from the main source categories as well as other categories.

Implementation so far: Article 6 of Regulation (EC) No 850/2004 on POPs addresses substances for which releases should be reduced and minimised, with a view to eliminate them if feasible. The six substances or groups of substances concerned are PCDDs, PCDFs, PCBs, HCB, PeCB and PAHs, as listed in Annex III of the Regulation. Of these, all with the exemption of PAHs are listed in the Stockholm Convention and are therefore the main focus for the present implementation plan.

According to Article 6 of the POP Regulation, Member States shall draw up and maintain release inventories for the substances listed in Annex III into air, water and land in accordance with their obligations under the Convention and the Protocol. Member States were obliged to do so by 20 May 2006 for PCDDs, PCDFs, PCBs, and HCB and by 26 August 2012 for PeCB which was listed in 2010.

Article 5 of the POP Regulation further stipulates that Member States shall develop an action plan on measures to identify, characterise and minimise the releases of unintentionally produced POPs. The action plan shall include measures to promote the development and, where it deems appropriate, shall require the use of substitute or modified materials, products and processes to prevent the formation and release of the substances listed in Annex III.

Member States shall furthermore, when considering proposals to construct new facilities or significantly to modify existing facilities using processes that release chemicals listed in Annex III of the Regulation, without prejudice to Directive 2010/75/EU (IED Directive), give priority consideration to alternative processes, techniques or practices that have similar usefulness but which avoid the formation and release of substances listed in Annex III.

Over the past twenty years, important legislation has been adopted to reduce the emissions of PCDD/F, in particular in the areas of waste incineration and integrated pollution prevention and control, resulting in decreasing levels in the environment and in the human population (see section 3.3.2).

Inclusion of all five substances in the Water Framework Directive has further contributed to the reduction of emissions of these substances into aquatic environment, as Member States have an obligation to ensure that concentrations of these substances in the environment is below the environmental quality standard level.

The implementation of the BAT conclusions adopted under the IED which establish Emission Levels Associated with the Best Available Techniques (BAT-AELs) will be another step to further reduce releases of PCDD/F and other unintentionally produced POPs from industrial activities.

The Union Strategy for Dioxins, Furans and Polychlorinated Biphenyls adopted in 2001 (COM (2001) 593)⁴¹ had the goal to assess the current state of the environment and the ecosystem, to reduce exposure from dioxins and PCBs to humans and the environment. In October 2010 the Commission adopted the third progress report on the Dioxin strategy (COM (2010) 562 final)⁴³ for the period 2007 to 2009. The report showed that over the last two decades 80% reduction of industrial emissions of PCDD/Fs and PCBs was achieved.

Since most measures reducing PCDD/F releases also reduces the formation and release of unintentionally produced PeCB, HCB, PAH and PCB, it can be assumed that the above mentioned reduction of PCDD/F already had a similar effect for these other UPOPs.

Further progress is expected within the framework of the European Union Implementation Plan on Persistent Organic Pollutants and the relevant National Action Plans (NAPs) elaborated by Member States..

Analysis: In section 3.3 of Part I, it is described that in the EU the release from POPs due to unintentional production remains one of the most important issues to be tackled. Several actions are thus dedicated to the development of corresponding measures with the goal to reach a further reduction of POP emissions.

As the production of unintentional POPs is largely related to industrial processes such as production of iron and steel (sinter plants, electric arc furnaces), the production of non-ferrous metals, the incineration of waste etc, the legislation dealing with industrial emissions is the main instrument to tackle releases of unintentionally produced POPs. Recently, the IPPC Directive has been replaced by the Industrial Emissions Directive (IED) that came into effect in January 2013. Further improvement of the situation is expected with the IED, because the BAT Associated Emission Levels (BAT-AELs) as listed in the BAT conclusions are to be used directly when issuing permits for industrial installations.

As the IED has a much wider scope than just reduction of POP emissions, it is important that POP-related expertise is present in the discussion related to its implementation. This applies particularly for the review of the relevant BREFs (especially those on "Non-Ferrous Metal Industries", "Large Combustion Plants", "Ferrous Metals Processing", "Waste Incineration", "Waste Treatment") , where involvement of POP-experts must be encouraged to make sure that the prevention of the formation as well as the control of POP releases is taken adequately into consideration with a view of developing BAT conclusions (including BAT-AELs where possible) concerning emissions of unintentionally produced POPs.

Action 8: "Commission and Member States to ensure that BAT conclusions under the IED and related implementation measures consider the reduction of emissions of unintentionally produced POPs, including their potential transfer to other media and their presence in waste"

For solid materials residues (fly ashes) and articles other than food and feed no PCDD/F regulation exists and the only relevant limit is the low POPs content of 15 ng TEQ/g as low POPs content. This value is high and there is a considerable debate on this provisional Basel Convention low POPs limit. For fly ashes in Japan e.g. a limit of 3 ng TEQ/g exist and in the incineration BREF fly ash values from German incinerators below 0.5 ng TEQ/g are mentioned

Action 9: To assess levels of PCDD/PCDFs in critical solid residues (fly ashes) and articles and take action to possibly develop BAT and maximum concentrations in this respect

In addition to emissions from the large industrial installations also small scale incinerators and diffuse sources are contributing to the release of PCDD/PCDF and other UPOPs.

One activity which can contribute to reduction of UPOPs in this sector is the minimum eco-design requirements for solid fuel small combustion installations. Even though preparatory work is underway concerning this action it is being renewed here as the inclusion of POP-related aspects (especially the generation of unintentionally produced POPs) should be a main focus of the still to be developed implementing measure (cf. section 3.3.3).

Action 10: Commission to table an implementing measure to set out minimum eco-design requirements for solid fuel small combustion installations.

4.6.1. Pentachlorobenzene (PeCB)

PeCB has been newly listed in the Stockholm Convention Annexes C and A without exemptions. In the EU PeCB is not intentionally produced it is only addressed in the section of UPOPs .

According to the results of the EU PRTR (2009 data) PeCB remains unintentionally produced in the EU due to releases largely from the metal industry and minor impact from power production from coals. Emissions from domestic sources are only partially addressed by measures. According to PRTR (2009) by far the largest PeCB release to water (640 kg) is reported from a French chemical company producing basic organic chemicals ((see section 3.2.5 above). In such cases, an integrated view is required looking at all emissions of halogenated compounds and other pollutants to understand the individual situation. It would be beneficial if the company or respective Member State assesses what BAT measures for reduction of this key PeCB emission source could be used.

The two metal facilities with PeCB release to the air reported 107 kg and 240 kg respectively (PRTR 2009). This suggest that all other similar facilities also can be expected to have releases of PeCB (and probably HCB¹⁷¹) considerably above 1 kg/year which would mean that most probably for similar facilities PeCB should have been reported in the PRTR. One reason for these inconsistencies and missing data could possibly be the lack of measurements of PeCB and HCB in IPPC facilities as there are no legal requirements for PeCB and HCB measurements.

Production of chlorinated organics and their deposits from historic production were described in a recent POP Reviewing Committee Report (UNEP 2010c)¹⁷² as probably the largest global source of PeCB . Therefore it seems necessary to increase understanding of PeCB emissios among the chemical industries and improve the PRTR database of PeCB releases.

171 Furthermore this two facilities reporting on elevated PeCB air emissions have not reported on HCB emissions. Since the ratio of PeCB to HCB in such thermal sources are normally between 0.2 and 2, the HCB from these two facilities can also be estimated in the order of several 10 kg/year and should have been reported to PRTR.

172 UNEP (2010) “Additional consideration of new persistent organic pollutants: pentachlorobenzene” Stockholm Convention document from 6th POP Reviewing Committee meeting (UNEP/POPS/POPRC.6/INF/8)

Up to now measures to reduce unintentionally produced POPs largely focused on PCDD/PCDF. While the reduction of formation of PCDD/PCDF (primary measure) will at the same time also reduce PeCB (and other new POPs) secondary measures like adsorption technologies might have to be adjusted to also address the more volatile PeCB.

Action 11: The Commission to work with Member States to examine how the characterisation of PeCB releases can be improved, and to identify whether BAT/BEP could be appropriately updated to further decrease PeCB releases.

4.7. Identification and environmentally sound management of stockpiles and wastes

Obligations: Article 6: To develop appropriate strategies for identifying stockpiles, products and articles containing, consisting of or contaminated with chemicals listed in Annexes A, B or C; manage stockpiles in a safe, efficient and environmentally sound manner; implement measures to reduce or eliminate releases from stockpiles and wastes containing chemicals listed in Annexes A, B or C in a manner that protects human health and the environment; take appropriate measures to ensure that waste products and Articles containing chemicals listed in Annexes A, B or C are handled in an environmentally friendly manner; dispose waste products and articles containing chemicals listed in Annexes A, B or C in a way that destroys the POPs content, taking into consideration the Technical guidelines for the environmentally sound management of persistent organic pollutant wastes developed under the Basel Convention.

Implementation so far: The Waste Framework Directive 2006/12/EC and the Hazardous Waste Directive 91/689/EEC (both Directives are repealed by Directive 2008/98/EC), set a number of provisions that ensure wastes including stockpiles are handled in an environmentally sound manner (see Annex I). Amongst others, this includes waste prevention promotion, classification rules for hazardous waste, the obligation to collect waste and to package and label it appropriately, to elaborate waste management plans, to permit waste disposal and recovery installations and the prohibition to dispose of waste in an uncontrolled manner.

Article 5 of the Regulation (EC) No 850/2004 requires stockpiles to be managed as waste. The holder of stockpiles greater than 50 kg, consisting of or containing any POP and the use of which is permitted shall provide the competent authority with information concerning the nature and size thereof. The stockpile shall be managed in a safe, efficient and environmentally sound manner. Member States must monitor the use and management of notified stockpiles.

Article 7 of the Regulation (EC) No 850/2004 sets that producers and holders of waste are obliged to undertake all reasonable efforts to avoid contamination of waste with POP substances. Waste consisting of, containing or contaminated by POPs shall be disposed of without undue delay. Waste with POPs content higher than the lower POP limits set in the Regulation must generally be disposed or recovered in such a way that the POP content is destroyed or irreversibly transformed. Also those wastes, which are managed in an

environmentally preferable way instead of being destroyed or irreversibly transformed have to meet the upper POP concentration limits set by the Regulation¹⁷³.

Analysis: The existing legal framework basically ensures the environmentally sound management of stockpiles and waste consisting of contaminated or containing POPs. Some actions should be envisaged as follow-up or complementation of the tasks to be addressed by the Basel Convention (see following subchapter).

With regard to obsolete pesticides the Commission Study (BiPRO 2005)¹⁷⁴ estimated that there are stocks containing 5.370 tonnes in the EU, mainly in the new Member States joined in 2004. Information about Romania and Bulgaria is not available.

In addition the last ECIP estimated 500000 t of deposited HCH waste which at that time were not POPs waste. With inclusion of alpha-, beta- and gamma-HCH these deposited wastes can largely be considered the POPs waste since the other isomer contribute only a minor share of HCH waste isomers (IHPA 2006 a,b, Vijgen et al. 2011). An updated assessment revealed that deposited HCH wastes within the EU might amount up to 1.8 to 3 million tonnes considering a lindane production volume of 300000 t (Vijgen et al. 2011).

Further locations and quantities of POPs Pesticides may be still found in the course of the elaboration of the National Implementation Plans and hazardous waste management plans.

The issue should be primarily dealt with on a Member State level. The costs should be borne by the "polluter-pays" principles as laid down in the Waste Framework Directive.

Beyond that European Union's funds are eligible for the disposal of the stockpiled obsolete pesticides.

Other new POPs in products in use, in the waste flow and in disposal schemes are PBDEs and PFOS. Since they are mostly included in articles (see chapter 3.2) but also in matrices like sewage sludge the assessment of their disposal is more complex.

4.7.1. *Disposal and destruction of PBDE containing materials*

The "Technical Review of the Implications of Recycling Commercial Pentabromodiphenyl Ether and Commercial Octabromodiphenyl Ether" (UNEP/POPs/POPRC.6/2 and related Annexes UNEP/POPs/POPRC.6/INF/6) from the POP Reviewing Committee (UNEP 2010a,b)¹⁷⁵ emphasized that most recovery and destruction technologies where PBDE containing materials are treated have not been assessed for their appropriateness (destruction efficiency and releases).

The COP5 recommendations in this respect were:

- To generate and collect information on releases of brominated diphenyl ethers and unintentionally produced brominated organic compounds such as

¹⁷³ The upper concentration limits are not valid for permanent underground landfilling. Regulation 172/2007 amending Regulation 850/2004: „These limits exclusively apply to a landfill site for hazardous waste and do not apply to permanent underground storage facilities for hazardous wastes, including salt mines.”

¹⁷⁴ BiPRO (2005): Study to facilitate the implementation of certain waste related provisions of the Regulation on Persistent Organic Pollutants (POPs). ENV.A.2/ETU/2004/0044. European Commission, DG Environment, Brussels 2005.

¹⁷⁵ UNEP (2010) "Technical Review of the Implications of Recycling Commercial Pentabromodiphenyl Ether and Commercial Octabromodiphenyl Ether" from 6th POP Reviewing Committee meeting Geneva October 2010 ((a) UNEP/POPs/POPRC.6/2 and related Annex report (b) UNEP/POPs/POPRC.6/INF/6).

polybrominated dibenzodioxins and polybrominated dibenzofurans (PBDD/PBDF) in emissions to air and in the solid residues from thermal processes used in treating materials contaminated with brominated diphenyl ethers.

- To identify disposal options that would comply with the Stockholm Convention guidelines to be developed for the destruction of wastes containing brominated diphenyl ethers. These may include best available technique incinerators with effective primary and secondary combustion zones that operate under best environmental practice conditions with continuous monitoring and sampling to ensure that brominated diphenyl ethers and/or PBDD/PBDF are not released.
- To undertake further assessment and produce best available technique and best environmental practice guidance. These tasks should be undertaken by the Stockholm Convention's expert bodies and include consideration of polybrominated diphenyl ethers and PBDD/PBDF releases from smelters and other thermal recovery technologies, including secondary metal industries, cement kilns and feedstock recycling technologies.
- To improve and extend as necessary disposal options to ensure compliance with Stockholm Convention obligations and guidelines, taking into account the relevant decisions of the Persistent Organic Pollutants Review Committee on the updating of the Basel Convention technical guidelines on the environmentally sound management of persistent organic pollutants.
- To collect information relevant to the establishment of best available techniques and best environmental practices for treatment and disposal techniques for materials containing brominated diphenyl ethers.

As described in chapter, the largest part of PBDE containing materials has been disposed off. Depending on the quality of the landfills and the leachate controls POPs could be released from such deposits and contaminated the environment (Weber et al. 2011)¹⁷⁶.

The COP5 also discourage the landfilling of PBDE containing waste and recommends in this respect

- Reducing releases of polybrominated diphenyl ethers from landfills by avoiding the landfilling of waste containing them. Significant reductions can be made by restricting the landfill disposal of waste streams with high concentrations of brominated diphenyl ethers. A “proper management to isolate the landfill contents” permanently from the environment cannot be achieved. Therefore maximum concentration limits for (above-ground) landfills for hazardous waste pursuant to Annex V of the POP Regulation should be set..
- Assessing further the long-term chemistry of polybrominated diphenyl ethers in landfill sites and the fate and risk of polybrominated diphenyl ether release from landfills into the environment.
- Providing guidance for MS on how to focus efforts on products/materials with the highest concentrations of PBDEs and PFOS. The guidance could also include

176 Weber R , Watson A , Forter M , Oliaci F. (2011): Persistent Organic Pollutants and Landfills - A Review of Past Experiences and Future Challenges. Waste Management & Research 29 (1) 107-121.

techniques for identification and separation of materials and products with high POPs concentrations.

Action 12: The Commission shall set concentration limits for PBDEs in the POP Regulation so as to ensure an environmentally sound disposal of these wastes.

Another part of PBDE containing materials is thermally treated at the end of life. A share of waste ends up in dedicated waste incinerators while several PBDE containing materials are treated at in metal industries and possibly co-incinerated in cement kilns. The report for the POP reviewing committee has summarized the following point:

- Most metallurgical processes fall into the category of end-of-life treatments rather than recovery operations in relation to treatment of PBDE. Whilst metals are recovered for recycling the polymer to which the PBDE had been added is not recovered. Instead it is used for the recovery of energy. Alternatively it may have been introduced to the process incidentally due to a failure to separate PBDE-containing materials from the metals being recovered. An example would be where scrap cars were compacted for recovery in secondary steel industry without first removing all the PBDE-containing polymers). The presence, and recovery, of the metal in these cases is due to the mixing processes, usually shredding or compacting, used in disassembly rather than to any specific use of PDE in metal components. This allocation is slightly more ambiguous when considering material and energy recovery in smelters used for tens of thousands of tonnes of PWB, some containing PentaBDE in the resin, as BFR containing plastic is often added to the process.

Options for energy recovery of plastics containing PBDE (or just the recovery of metals incidentally mixed with BDE-containing plastics) include:

- a) Electric arc furnaces for iron scrap recycling (entering e.g. with car scrap))
- b) Secondary aluminium (entering e.g. with electronic waste parts)
- c) Antimony recovery from PBDE/BFR plastics containing antimony
- d) Energy recovery from PBDE/BFR containing high calorific waste in cement kilns
- e) Energy recovery and, in theory at least, bromine recovery from PBDE/BFR containing materials in incinerators

As highlighted by the POP Reviewing Committee report these facilities with the exemption of BAT incinerator have not been assessed for their appropriateness (destruction efficiency) of processing PBDE containing materials. The POP Reviewing Committee report further highlights that in these applications PBDD/PBDF and PXDD/PXDFF are likely to be formed and should be considered for the assessment of these facilities (UNEP 2011a,b)¹⁷⁵.

Action 13: The Commission and Member States as part of the regular review process of BREFs to evaluate how PBDE containing materials are dealt with within IED activities and to identify whether BAT/BEP could be included / updated to prevent, and where that is not possible to minimise emissions of brominated and brominated-chlorinated dioxins.

4.7.2. *Disposal and destruction of PFOS and PFOS precursor containing materials*

Disposal of PFOS containing materials:

In respect to end of life of PFOS containing articles the COP5 recommends

- No landfilling of these wastes should be permitted, unless leachate containing PFOS is properly treated.
- Resulting sludge, adsorbents and wastes containing PFOS should be destroyed and not deposited.

In the past much of PFOS containing materials (e.g. carpets and furniture) have been deposited. Considering the water solubility of PFOS and that the lifetime of PFOS is longer than securing measures of landfills (in the time frame of a few decades up to possibly a century), all PFOS and PFC will be released over time even from BAT landfills (Weber et al. 2011). Therefore there is no justification to deposit PFOS containing materials considering the burden such practice would bring to future generations.

Action 14: The Commission shall set concentration limits for PFOS in the POP Regulation so as to ensure an environmentally sound disposal of these wastes.

Destruction of PFOS containing materials:

The basis for the COP5 recommendations in respect to management of PFOS containing residues is

- To use best available technique and best environmental practice destruction technologies for wastes containing PFOS in current production and industrial uses of PFOS.

Since the C-F bond is more stable compared to other carbon-halogen bond, the destruction of PFOS and other PFCs require appropriate destruction technologies like BAT hazardous waste incinerators (operated normally at 1100°C). PFOS containing materials like carpets or coated paper end up to a considerable share in municipal waste incinerators (operated at 850°C). Further PFOS containing sewage sludge end up partly in sewage sludge incinerators often operated at lower temperature compared to municipal waste incinerators. Full scale tests with assessment of destruction efficiency and degradation products have not been published for municipal waste incinerators and sewage sludge incinerators.

It is advisable that Member States share information among themselves and with the Stockholm Convention Secretariat on their experiences with PFOS destruction projects and appropriate destruction technologies .

4.7.3. *Disposal and destruction of POPs Pesticides*

Data reported by Member States has shown that there are still a number of existing stockpiles of POP pesticide and POP-containing wastes. The inclusion of HCH into the Convention leads to the necessity of assessment and possibly remediation of HCH waste deposits. Some of such deposits have been cleaned or secured in the past. This is primarily for the action at the Member States level.

4.7.4. *Destruction of PCB and PCB containing materials*

Several European countries are importing PCB and other POPs containing wastes for destruction. It has been revealed that the activity of a major importer of PCB waste to Germany (ENVIO) led to the contamination of workers and resulted in the contamination of storage sites and the area where the PCB transformers were treated. It is advisable that Member States share their experience and lessons learned from such cases.

PCB destruction of open applications: As mentioned above, PCBs have been used in anti-corrosion paints (e.g. bridges and other constructions, electric poles, large water pipes) in the 1950s to the early 1970s. Some of these equipments come to end of life stage and need to be treated. The large metal parts are normally recycled in electric arc furnaces (EAF) and possibly other secondary metal processing plants. Since the combustion processes in these batch type operations can be considered incomplete, most probably a considerable share of these PCBs are evaporated and not destroyed. This is supported by the relatively high emissions of PCB reported from EAF. Furthermore the conditions in such facilities are favourable to form PCDF with associated increase of toxicity, Currently there is no assessment how much PCB painted scrap are entering the end of life and enter secondary metal treatment. Also no dedicated tests have been published on releases associated with such practice. However it is known from measurements in EAF that considerable PCB loads are emitted which only can be explained by PCB input by treated material and cannot be explained by unintentionally formation of PCB in this processes¹⁷⁷.

Another open application are sealants containing PCB in buildings from the 1960th and 1970th. A share of these buildings is renovated in the frame of insulation measures while another share is torn down.

It is advisable that Member States share their findings on the PCB contaminated construction materials and paints and share their experiences in handling such waste.

4.8. Identification of contaminated sites (Annex A, B and C Chemicals) and if addressed then remediation in an environmentally sound manner

Obligations: Article 6 1 (e) emphasize that parties “Endeavour to develop appropriate strategies for identifying sites contaminated by chemicals listed in Annex A, B or C; if remediation of those sites is undertaken it shall be performed in an environmentally sound manner”

¹⁷⁷ Also the PCB pattern from EAF have often a congener finger print of industrial PCBs demonstrating that the main PCB release stem from the input material and are not unintentionally formed.

Implementation so far: As regards the identification and remediation of sites contaminated by chemicals in Annexes A, B or C, the Commission has adopted in September 2006 a Thematic Strategy on soil protection and made a proposal for a framework Directive on the protection of soil. This proposal requires Member States to prevent soil contamination, to make an inventory of contaminated sites (including sites contaminated by substances in Annexes A, B and C) and to remediate the sites identified. Member States are also required to take measures to raise awareness and promote the transfer of knowledge and experience for a sustainable use of soil. This could include an exchange of information on the best available technologies for the remediation of POP-containing sites. The Strategy and the proposal have been sent to the other European Institutions for the further steps in the [decision-making process](#). Discussions are still on-going to reach a political agreement and thus the protection of soils is currently an exclusive competence of Member States.

The Water Framework Directive includes many POPs and hence imposes monitoring obligations on Member States regarding their presence in ground water and surface waters. In this respect it provides a mechanism to identify contaminated sites associated with water bodies.

Analysis: As described above (3.4), several POPs (e.g. PCB, HCH, PCDD/PCDF, PAH, PFOS) have resulted in a wide range of POPs contaminated sites. Due to the relative mobility of POPs these sites are a threat for the wider environment and by contamination of related river systems and the fish or flood plains and related grazing cattle also impact human nutrition. Furthermore the more water soluble POPs (PFOS and HCBd) also contaminate related ground and surface waters and can impact drinking water.

For the EU, the historical contamination of soil with HCH is probably one of the main problems linked to POP compounds. Identification and quantification of the extent of this problem to develop appropriate risk management should be regarded as a priority action for the Member States.

5. IMPLEMENTATION OF THE OBLIGATIONS ON SUPPORTING ACTIVITIES

5.1. Information exchange

Obligation: Article 9: To facilitate or undertake information exchange relevant to the reduction or elimination of the production, use and release of POPs and alternatives to POPs including information relating to their risks as well as their economic and social costs. This information exchange, either directly or through the Secretariat, can also be used to develop alternatives to POPs. Where Parties exchange information on health and safety of humans and the environment it must not be treated as confidential. Parties that exchange other information must protect any confidential information as mutually agreed.

COP5 recommendations:

- To exchange information on and experiences of successful environmentally sound handling, management and disposal of articles and wastes containing brominated diphenyl ethers.
- Especially developed countries, are encouraged to exchange their experiences and success stories with other countries. Results should be reported to the Secretariat/COP which should result in valuable information for developing and transition countries and support implementation in these countries.

Implementation so far: The Commission is disseminating widely information on these activities mainly through the Europa-website with the Directorate-General Environment hosting the POP-specific website but also by different publicly accessible databases such as Eur-Lex, statistic databases of Eurostat, the E-PRTR, the EU pesticide database, and databases of EU institutions on specific topics e.g. the European chemical Substances Information System (see section 2.5). In addition, risk assessment reports are made publicly available, as well as the voluntary risk assessment reports submitted to ECHA based on industry initiative.

Analysis: Obligations derived from the implementation of the POP Regulation are changing (cf. 2009 addition of new substances as well as 2011 addition of endosulfan) and stakeholders concerned by these changes need to be proactively informed and supported in the implementation of the corresponding obligations. This could inter alia take place via workshops, projects in cooperation with associations and federations (industry and NGOs) as well as common dissemination strategies such as websites and paper documentation.

Action 15: Commission and Member States to ensure that all players (including industry) are fully informed about the obligations under the Stockholm Convention.

Action 16: Commission and Member States to exchange their experiences and success stories with other countries.

Action 17: Commission to facilitate the identification of substances that can be used as alternatives to POPs and to disseminate their risk assessment reports more widely.

5.2. Public information, awareness and education

Obligations: Article 10: Promote and facilitate awareness of POPs, among policy and decision makers, and, along with industry and professional users, provide and facilitate up-to-date information to the public as well as develop education and training programmes. To give consideration to the development of mechanisms, including pollutant release and transfer registers, for the collection and dissemination of information on the release and disposal of chemicals listed in Annexes A, B and C. To consult with national stakeholders when developing and implementing the national implementation plan.

Implementation so far: Access to environmental information and consultation with stakeholders are an integral part of the Union environment policy. In general, a lot of emphasis is put on dissemination of information to citizens, industry and other interested parties on European Union's environment policy and activities. The main tool for public information is the Europa-website, a specific website dedicated to POPs and different European databases (see section 2.5).

As consultations with stakeholders are an integral part of the European Union's environment policy in order to provide opportunities for input from representatives of authorities, civil society or individual citizens, this present European Union Implementation Plan has been subjected to an open consultation (see Preface).

Analysis: According to the principle of subsidiarity, public information, awareness raising and education on POPs remain at the domain of the EU Member States. The Commission has concentrated on information on European Union legislation and other activities. Additional problem is the language: the EU has more than 20 official languages. The Commission has limited possibilities to put in place large information campaigns on POPs in all languages. However, information campaigns at European Union level are not excluded if they are deemed appropriate. As most Member States have developed their NIPs, it is now possible to evaluate the need for and the added value of such concerted action in the field of POPs.

Action 18: The Commission and Member States to evaluate the need for and the added value of a concerted action - coordinated information campaigns at European Union level - in the field of POPs taking into consideration the obligation of Member States to disseminate environmental information on POPs pursuant to Directive 2003/4EC³⁷.

5.3. Research, development and monitoring

Obligations: Article 11: To encourage research, development and monitoring of POPs on their sources, releases and transport to the environment, presence, levels, trends and effects in humans and the environment, socio-economic and cultural impacts, release reduction and/or elimination and harmonised methodologies for making inventories and analytical techniques for measuring releases. In taking this action, Parties should also support and further develop international programmes aimed at research, data collection and monitoring, support efforts to strengthen national scientific and technical research capabilities, take into account the concerns and needs of developing countries to improve their capability to participate, undertake research towards alleviating the effects of POPs and make the results of this available to the public and encourage and/or undertake cooperation with regard to storage and maintenance of this generated information.

Implementation so far: Research and development are essential for the support of policies such as inter alia consumer protection or the protection of the environment. The Framework Programmes (FP) are the main instrument for funding research and development in Europe. POP related research was funded in FP 5 (1998 – 2002), FP 6 (2002-2006) and the funding continued also in FP 7 (2007 – 2013). Details on projects funded under FP5 are given in the first Union Implementation Plan prepared in 2007. Under FP7, 39 projects have been selected for funding, addressing the issue of chemical pollution in the environment, with an EU contribution of over €140 M (see section 2.4). Details on projects funded under FP6 and FP7 are given in the Section 8 below.

The Joint Research Centre – the Commission's scientific body – has performed several monitoring activities of POP substances in the environment, has performed exposure assessment to POPs and contributed to the development of Toolkit¹⁷⁸ for the identification and quantification of releases of dioxins, furans and other unintentional POPs particularly by determination of emission factors for non-standard emission sources.

Under the Water Framework Directive (Directive 2000/60/EC), Member States are obliged to monitor substances placed on the priority list (many of which have POP characteristics), if they are discharged into the river basin or sub-basin. In addition, Member States have to

¹⁷⁸ <http://toolkit.pops.int>

monitor also other pollutants if they are discharged in significant quantities in the river basin or sub-basin.

Analysis: As regards the research and development, support will mainly come from Horizon 2020 Societal Challenge 1 “Health, Demographic Change and Wellbeing”, Societal Challenge 2 “Food Security, Sustainable Agriculture and Forestry, Marine, Maritime and Inland Water Research and the Bioeconomy” and Societal Challenge 5 “Climate Action, Environment, Resource Efficiency and Raw Materials” since POP substances are still used due to lack of alternatives.

There are a range of inconsistencies in PRTR data e.g. for PeCB, HCB and HCBd (see section 3.3.1). A research in characterisation of sources of these substances might be desirable to improve the situation.

As stated in section 0, prevention of the formation of unintentional POPs through the development of processes and technologies that avoid their formation should mainly be addressed in the area of industrial production but also cover domestic sources such as diffuse incineration sources. There is still need for additional research and technological development.

Though the coordination of research efforts already marks a good way towards the minimisation of effort duplication (see section 2.4.2), this action should be continued in the future. Especially the aspect of coordination and exchange at international level should be set more in focus. In this respect exchanges between research and development aid should be supported and further developed.

As regards the monitoring, despite the fact that Member States' authorities, research organisations and EU bodies are making significant efforts to monitor numerous chemicals in various matrices (water, air, biota, soil, human milk, etc.) as a consequence of EU legislation, national and international initiatives and scientific curiosity, there is a knowledge gap on the chemical burden. This occurs because the chemical data generated by the monitoring activities are not being collected, managed and assessed in a coherent manner and accessible manner. To address this gap, an information platform for chemical monitoring data should be established at the European scale which would ensure a coordinated and integrated approach to collecting, storing, accessing and assessing of data.

Action 19: Commission to ensure that the current EU Framework Programme for Research and Innovation Horizon 2020 will encourage research and innovation activities for the above identified challenges (alternatives, characterisation of sources, review of industrial process to avoid unintentional formation, data management, testing, and health impacts) and promote a coordinated approach between MS as well as with international counterparts inter alia long-term health impacts of exposure to POPs at environmentally relevant concentrations or development of affordable alternatives to POP substances still in use.

Action 20: Commission to support exchange of information and/or coordination of research both on Union and international level with a view to minimising duplication of effort.

Action 21: Commission to promote a more coherent approach to the generation, collection, storage and use of chemical monitoring data in relation to humans and the environment, through the creation of an information platform for chemical monitoring data.

6. IMPLEMENTATION OF OTHER COMMITMENTS

6.1. Technical assistance

Obligations: Article 12: To cooperate, in response to requests to provide timely and appropriate technical assistance to developing Parties and Parties with economies in transition, especially least developed countries and small island developing states, to assist them, to develop and strengthen their capacity to implement their obligations under the Stockholm Convention. Article 12.3 places an obligation on developed country Parties to provide such assistance and also mandates the establishment of regional and sub-regional centres for capacity-building and transfer of technology.

COP5 recommendations:

- To encourage developed countries to promote the transfer to developing countries of screening and separation techniques.
- The transfer of knowledge and technology, including capacity-building to identify PFOS in articles and applications and monitor PFOS in the environment, should be promoted to support full participation in global efforts to reduce PFOS risks.
- To encourage developed countries to promote the transfer to developing countries of screening and separation techniques (for PBDE containing materials).

Implementation so far: Union technical assistance responds to requests and is financed through its aid programmes which are described in section 2.3.2 and 2.3.3. The main instrument for assessing developing countries and partner organisations was the Thematic Programme for Environment and Sustainable Management of Natural Resources (ENRTP) within the EuropeAid. Technical assistance is also an important tool to build up synergies with the Basel Convention.

Analysis: The technical assistance for the implementation of the Stockholm Convention is taken up in the ENRTP “2011-2013 Strategy Paper & Multiannual Indicative Programme” as one point in “Priority 2. Environment for Development” and it is thus assured for the period until 2013. The need or focus for this technical assistance is so far not further specified.

Action 22: The European Union should develop mechanisms for better coordination between the bilateral aid programmes of the Commission and those of the Member States with regards to POPs.

6.2. Financial Assistance

Obligations: Article 13: All parties undertake to provide financial support and incentives in respect of those national activities that are intended to achieve the objective of the Stockholm Convention in accordance with their national plans, priorities and programmes. Developed

country Parties are required to provide new and additional financial resources through the financial mechanism to enable developing country Parties and Parties with economies in transition to meet the agreed full incremental costs of implementing measures which fulfil their obligations under the Stockholm Convention.

Basically, it is for the Member States rather than the Union to fund domestic implementation in accordance with Article 13.1. Nevertheless, the EU provides significant amount of funding both within the EU though in neighbouring countries and in developing countries, by different funding instruments in order to contribute to the implementation, updating and development of EU (environmental) policy (see section 2.3.1).

the European Commission provides funding to to developing and neighbouring countries directly and also contributes to multilateral and international programmes, such as the Voluntary Trust Fund of the Stockholm Convention and SAICM which promotes chemical safety worldwide (see section 2.3.3).

Analysis: The EU provides numerous funding programmes and instruments. However, there is no fund exclusively for the implementation of the Stockholm Convention. Indeed a specific fund to support to partner countries implement the Convention would not be in line with agreed international best practice in aid effectiveness since developing countries are in the best position to set their own priorities. Nevertheless the EU does recognise that for structural reasons, notably the absence of future generations in decision-making, environment tends to get neglected when countries decide on the use of aid allocated to them. It is for this reason that the EU has reserved a part of the development cooperation budget for environment through the ENRTP. This will continue under the next Multi-annual Financial Framework for the period 2014 – 2020 under the Global public Goods and Challenges (GPGC) Thematic Programme. . The Commission has looked for opportunities to increase requests for aid related to sound chemicals and wastes management, not least by being the second largest donor to the Quick Start Programme of the Strategic Approach to International Chemicals Management which works to raise political awareness and action on sound chemicals management in developing countries. The EU has played a leading role in the UNEP-sponsored process to define Financing Options for sound Chemicals and Wastes management (FOCW) which has resulted in agreement to launch a Special International Programme for capacity building for the Basel, Rotterdam and Stockholm Conventions and SAICM that will complement GEF support for the Stockholm Convention. Additionally, to increase awareness EU financial instruments that could support POP-related action could be summarized and indicated on the POP specific EU website.

Action 23: To consider the scope for funding POPs related assistance when preparing and approving the Thematic Strategy Paper (TSP) governing the use of the GPGC for the period 2014–2020 and thereafter when drawing up the Annual Action Programme (AAP).

6.3. Reporting

Obligations: Article 15: To report to the Conference of the Parties on the measures the Party has taken to implement the provisions of the Stockholm Convention and on the effectiveness of such measures in meeting the objectives of the Stockholm Convention. Reporting shall include data on the total quantity of production, import and export of the chemicals listed in Annexes A and B and a list of countries from which it has imported and exported substances.

Implementation so far: Both the Union and the Member States have to report to the COP according to the timetable laid down by the COP and in accordance with their respective competences. In order to provide information basis for reporting, Member States are obliged by Article 12 of the Regulation (EC) No 850/2004 to report regularly on the implementation of the Regulation to the Commission and the Commission should compile a summary and synthesis reports from these reports and forward them to the European Parliament and the Council. On issues which belong to the Union competence, the Commission is responsible for the joint reporting on behalf of the Union.

Analysis: Reporting from Member States to the Commission is a prerequisite for the EU to be able to identify further measures for the implementation of the Stockholm Convention and also for submitting adequate reports to the Stockholm Convention. However, several Member States have not yet met their reporting obligations and the Commission should launch infringement procedures in this respect to address the issue.

Following-up on national reporting under the POP Regulation and on the still to be delivered NIPs under the Stockholm Convention, the Commission should assess which specific exemptions and acceptable purposes are still needed respectively fix a timeline until when a complete phase-out is possible. There are hints that for example the main remaining acceptable purposes for PFOS are the use in metal plating industry and in aviation fluids (cf. section 3.2.4). For all other registered applications PFOS seems to have been phased-out. However, this would have to be verified with data and information reported by the EU's Member States.

Action 24: Commission to launch infringement procedures against the Member States in case of non-compliance.
--

Action 25: Commission to verify the need for continuation of specific exemptions and registered acceptable purposes for Annex A and Annex B substances.

6.4. Effectiveness evaluation

Obligations: Article 16: Conference of the Parties to periodically evaluate the effectiveness of the Stockholm Convention, starting four years after entry into force. The evaluation will be conducted on the basis of available scientific, environmental, technical and economic information.

Implementation so far: Article 9 of Regulation (EC) No 850/2004 stipulates that the Commission and the Member States shall establish, in close cooperation, appropriate programmes and mechanisms, consistent with the state of the art, for the regular provision of comparable monitoring data on the presence of dioxins, furans and PCBs as identified in Annex III in the environment.

Harmonised monitoring at EU-level exists for emissions of all by-product POPs through the release register E-PRTR. There is also harmonised monitoring in the area of feed and food where it is recommended that a number of defined food and feed samples are analysed yearly. Common methods for sampling and analysis ensure comparability of the results that will be compiled by the Commission in a database with the aim of having a clear picture of the time trends in background presence of these substances in feed and food.

Under the Water Framework Directive (Directive 2000/60/EC), Member States are obliged to monitor substances placed on the priority list (many of which have POP characteristics), if they are discharged into the river basin or sub-basin. In addition, Member States have to monitor also other pollutants if they are discharged in significant quantities in the river basin or sub-basin.

In order to check the feasibility of an EU coordinated approach to Human Biomonitoring (HBM), a research project on the development of a coherent approach to human biomonitoring in Europe¹⁷⁹ was granted under the FP6 that lead into a concept to establish biomonitoring as a policy making tool. HBM is an effective tool to evaluate the effectiveness of policies because it allows good assessment of temporal trends in total human exposure to environmental pollutants. In December 2009, under the FP7 funded EU project COPHES, a consortium of experts from nearly all EU countries began to work towards an EU HBM framework. The goals of the work are to harmonise national and local activities on HBM to contribute to better data comparability across the EU and to coordinate HBM programmes across the EU. This initiative has been accompanied by a feasibility study called DEMOCOPHES which started in September 2010 and was financed from Life plus. Both projects have now been finalised and their results demonstrated that a more coordinated and harmonised approach to HBM in Europe is useful to protect the health of Europeans also in the future¹⁸⁰

Analysis: The Union and the Member States will continue to play an active role in the international work regarding the effectiveness evaluation and will continue to generate exposure data for their territory. An information platform for chemical monitoring data will be established, to improve accessibility of the data and coherence in collection, management and assessment (see section 5.3). The platform will improve effectiveness evaluation of the implementation of the POP Regulation and of the Stockholm Convention in the EU by facilitating access to the chemical monitoring data across EU and by improving comparability of the data.

6.5. Addition of Future Chemicals to the Stockholm Convention

Obligations: The Stockholm Convention does not lay down any particular obligation concerning addition of chemicals to it but allows any Party to propose amendment of the Stockholm Convention by listing of further substances in it.

Implementation so far: The Commission has initiated the inclusion of several of the new POPs and supported the proposals submitted by other parties. Also the candidate POP SCCP has been proposed by the EU (see section 3.5).

Analysis: The Union and the Member States have put throughout the negotiations on the Stockholm Convention a lot of emphasis on the widening of the initial list of 12 POP substances to additional POP substances warranting global action. The proper functioning of the POP Review Committee is of crucial importance in this regard. It is evident that the Commission and the Member States need to actively participate in and support the POP Review Committee in its work in order to ensure timely and thorough evaluation of the submitted proposals.

¹⁷⁹ http://cordis.europa.eu/search/index.cfm?fuseaction=proj.document&PJ_RC�=7917953
¹⁸⁰ <http://www.eu-hbm.info>

Through the implementation of the EU legislation, particularly of REACH Regulation and Water Framework Directive, the EU is in the possession of a huge amount of valuable chemicals data. This data should be used to assess any further candidates for the inclusion into the Stockholm Convention and the POP Protocol.

The addition of the new substances to the POP Protocol in 2009 goes along with a restriction on production and use except for certain exemptions. The Commission is to verify implementation of these provisions in the EU through data gathering and exchange with Member States.

Action 26: “Commission and Member States to continue work on identification of potential POP substances warranting international action. Commission to initiate formal proposals by the Union, when appropriate. Commission and the Member States to increase and strengthen Union wide and international cooperation and information exchange concerning identification of potential POP substances and on concentrations of emerging POP substances especially in remote regions and on the extent of trans-boundary dispersion”.

7. EU RESEARCH PROJECTS SINCE 2007 WITH REFERENCES TO POP ISSUES

Table 8 Research Projects with references to POPs funded under FP7 (by June 2011)

No.	Acronym, Project Title, EU contribution	Programme, Duration time	Short description and main objectives	More information
1	ACROPOLIS, Aggregate and cumulative risk of pesticides: an on-line integrated strategy, EU Contribution €3M	FP7-KBBE Start date: 2010-06-01 End date: 2013-05-31	Improvement of cumulative exposure assessment and cumulative hazard assessment methodology; Development of new models for aggregated exposure assessment addressing different routes of exposure; Setting up of new toxicological testing for identifying possible synergistic effects and development of a strategy for refinement of cumulative assessment groups; Integration of cumulative and aggregate risk models integrated in a web-based tool, including accessible data for all stakeholders; Improvement of the understanding of cumulative risk assessment methodology of different stakeholders.	http://acropolis-eu.com/
2	ARCRISK, Arctic Health Risks: Impacts on health in the Arctic and Europe owing to climate-induced changes in contaminant cycling, EU Contribution €3.5M	FP7-ENVIRONMENT Start date: 2009-06-01 End date: 2013-12-31	Exploration and use of selected climate change and chemical usage scenarios, the changing routes and mechanisms by which persistent chemical pollutants and air pollutants are delivered to the Arctic and the possible role of global climate change; Study of the deposition and accumulation of air pollutants and persistent chemical pollutants on snow/ice and on ice-free surfaces, their fate and transfer to aquatic food chains with melt-water runoff; Exploration of the transfer of pollutants from the abiotic Arctic environment into the base of food chains and to higher trophic level organisms (e.g., fish, marine mammals, reindeer) consumed by humans; Comparison of the role of climate change on the transport, fate and food web transfer of pollutants in the Arctic to the situation in relevant selected areas with exposed local populations in the EU; Identify and quantify the current main health outcomes in relation to exposure to 'legacy' contaminants in selected populations in the Arctic and exposed local populations in the EU.	http://www.arcrisk.eu/

3	BASELINE, Selection and improving of fit-for-purpose sampling procedures for specific foods and risks, EU Contribution €5.15M	FP7-KBBE Start date: 2009-08-01 End date: 2013-07-31	Review of the sampling schemes currently available for food authorities and food producers to perform food safety quantitative risk assessment in a European level; Assessment of the relevance and suitable limit values of Performance Objectives (POs) and Food Safety Objectives (FSOs) for biological and chemical risks; Evaluation of the need for new or adapted methods for sampling and testing of the risk factors identified. The selected protocols and methods should be able to produce suitable data for risk analysis; Development of predictive mathematical models for biological risks and investigate and model sources and pathways of chemical contaminants to improve sampling schemes; Validation and harmonisation of the sampling schemes developed in the project and alternative detection methods; Sharing and dissemination of the scientific knowledge deriving from the project to stakeholders.	http://www.baselineurope.eu/
4	BASIS, PAH Anaerobic Biodegradation Assessment by Stable Isotope Technologies, EU Contribution €170,000	FP7-PEOPLE Start date: 2011-05-01 End date: 2013-04-30	The main goals of this proposed project are to assess in situ biodegradation of PAHs under anaerobic environments in marine and fresh water systems, to describe microbial activities and to identify microbial key players	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b705787f3ad5:58e8706f&RCN=98660 - no project website yet
5	BAYEX, Atmospheric Exchange of Persistent Chemicals in Bothnian Bay, Northern Baltic Sea, EU Contribution €240,000	FP7-PEOPLE Start date: 2011-04-15 End date: 2013-04-14	Atmospheric deposition and air-sea exchange of persistent chemicals in Bothnian Bay are investigated with goals of understanding current atmospheric loadings and how future loadings will respond to changes in ice cover and air concentrations	http://eu.project.umu.se/projectweb/4a851ad5f0ec5/Baltic%20region.html http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b701efac:1e64:56f2a86f&RCN=96896 - no project website yet
6	BRIDGE, Bridging mechanisms into risk assessment: An integrated European research network targeting contaminants in milk, EU Contribution €3.48M	FP7-KBBE Duration: 36 months	Risk assessment data for exposure to contaminants in milk, particularly during the vulnerable stages of foetal and infant development; characterisation of the endocrine disruptive effects of chemical and microbiological toxins in milk and produce novel tools to improve consumer safety and prevent disease.	http://www.ncp-bio.net/media/document/successstories/bridge.pdf - no project website yet

7	BROWSE, Exposure models to assess the risks to operators, workers, residents and bystanders from exposure to plant protection products (PPPs), EU Contribution €2M	FP7-ENVIRONMENT Start date: 2011-01-01 End date: 2013-12-31	Review, improve and extend the models currently used in the risk assessment of plant protection products (PPPs) to evaluate the exposure of operators, workers, residents and bystanders. Use the new and improved exposure models to contribute to the implementation of Regulation 1107/2009 on authorisation of PPPs, replacing Directive 91/414/EC and the implementation of the Thematic Strategy on the Sustainable Use of Pesticides. Involve all relevant stakeholders and end-users and take full account of relevant gender issues in developing the exposure models and policy tools.	http://cordis.europa.eu/fetch?CALLER=FP7_ENV_PROJ_EN&ACTION=D&DOC=56&CAT=PROJ&QUERY=0129fe7c8e02:8b2f41abc192&RCN=97105 - no project website yet
8	CADASTER, Case studies on the development and application of in silico techniques for environmental hazard and risk assessment, EU Contribution €2.69M	FP7-ENVIRONMENT Start date: 2009-01-01 End date: 2012-12-31	The project provides a practical guidance to integrated risk assessment by carrying out a full hazard and risk assessment for chemicals belonging to four compound classes. Collection of data and models; development and validation of QSAR models; integration of QSARs within hazard and risk assessment; outreach via development of website, newsletters/workshop(s) and standalone tools for dissemination of project results.	http://www.cadaster.eu/
9	CARBPOL, Investigating the role of the carbon cycle on the environmental fate of semivolatile organic pollutants, EU Contribution €170,000	FP7-PEOPLE Start date: 2008-04-01 End date: 2010-03-31	Semivolatile organic compounds (SOCs) are a heterogeneous class of chemicals including many ubiquitous toxic pollutants such as the notorious persistent organic pollutants (POPs). The main hypothesis behind the present project is that the C cycle controls the global environmental cycling of SOCs.	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b706c02a:6e26:55bf2629&RCN=87358 - no project website yet
10	CLEAR, Climate Change, Environmental Contaminants and Reproductive Health, EU Contribution €2.37M	FP7-ENVIRONMENT Start date: 2009-05-01 End date: 2013-04-30	Identification and description of mechanisms by which climate change affect the exposure of Arctic and other human populations to contaminants through change in chemical use and emissions, delivery to the ecosystems as well as processing within the physical environment and human food chain; Expansion of the existing knowledge database on human contaminant exposure in the Arctic and selected European countries by measurements of biopersistent and non-persistent compounds in serum samples, namely polybrominated diphenylethers, perfluorinated surfactants, phthalates and metals; Increase knowledge on links between parental blood levels of environmental contaminants and reproductive health outcomes in terms of functional and biological measures of fertility and child development; Investigation of mechanisms related to effects of contaminants on reproductive health; Integration of data on relative climate induced changes in contaminant mobility and distribution, external and internal exposure of humans and links between contaminant exposure and health surveys into a risk assessment and risk evaluation.	http://www.inuendo.dk/clear/

11	CONFIDENCE, Contaminants in food and feed: inexpensive detection for control of exposure, EU Contribution €5.8M	FP7-KBBE Start date: 2008-05-01 End date: 2012-04-30	Provide long-term solutions to the monitoring of POPs, perfluorinated compounds, pesticides, veterinary pharmaceuticals (coccidiostats, antibiotics), heavy metals and biotoxins (alkaloids, marine toxins, mycotoxins) in high-risk products such as fish and fish feed; Assurance of quality and safety in the European food supply from farm to fork by the development of new simplified detection methods for chemical contaminants with effective features; development of new detection tools for key and emerging risks as recognised by the European Food Safety Agency (EFSA); improvement of consumer exposure assessments to achieve a better understanding of contaminant levels in food and feed; contribution to the validation of risk-benefit and predictive hazard behaviour models in accordance with the strategic agenda of the European Technology Platform (ETP) Food for Life; extensive dissemination and training of new detection methods to all relevant stakeholders, including industrial and governmental end-users and students, to advance technology exploitation.	http://www.confidence.eu/
12	CONTAMED, Contaminant mixtures and human reproductive health – novel strategies for health impact and risk assessment of endocrine disrupters, EU Contribution €3.5M	FP7-ENVIRONMENT Start date: 2008-05-01 End date: 2011-12-31	The project will explore the hypothesis that combined exposure to endocrine disrupting chemicals (EDC) in foetal life may lead to adverse delayed impacts on human reproductive health. Preparation of the ground for epidemiological studies able to capture cumulative EDC exposure by developing and evaluating biomarkers for total effective internal EDC load; Substantiation of observations from human studies in extended developmental toxicity rat studies by investigating the possible role of mixtures of oestrogens, anti-androgens and other classes of EDC in producing long-lasting delayed adverse reproductive effects at environmentally relevant levels; Bringing together human epidemiology and predictive toxicological risk assessment by comparing internal EDC exposures in humans with those resulting from controlled exposures producing clear effects in laboratory animal experiments; Searching for previously unrecognised EDCs in human tissues.	http://www.contamed.eu/
13	COPHES, Consortium to Perform Human Biomonitoring on a European Scale, EU Contribution €4M	FP7-ENVIRONMENT Start date: 2009-12-01 End date: 2012-11-30	The project will develop a coherent approach to human biomonitoring (HBM) in Europe, using existing and planned HBM projects and programmes of work and capabilities. It will investigate what is needed to advance and improve comparability of HBM data across Europe. Definition of priorities for biomonitoring of chemical exposures and effects in the general European population; improvement of comparability of HBM data in Europe by developing strategies to harmonise recruitment, sampling, quality control, data exchange, data analysis, and reporting strategies; guarantee of high scientific standards and use of up-to-date scientific technology and approaches in human biomarker development and integration of HBM into health impact assessment; provision of a communication strategy and common ethical standards, development of a programme for capacity building and of a concept for sustainable organisation and structure of an EU HBM network.	http://www.eu-hbm.info/

14	CYTOTHREAT, Fate and effects of cytostatic pharmaceuticals in the environment and identification of biomarkers for an improved risk assessment on environmental exposure, EU Contribution €2.58M	FP7-ENVIRONMENT Start date: 2011-01-01 End date: 2014-12-31	Assess the risks of pharmaceuticals released in the environment, focusing on cytostatic drugs because of genotoxic properties which may cause unexpected long term effects. Their release in the environment may lead to systemic ecological effects and increased cancer incidence, reduced fertility and malformations in the offspring in humans. Special emphasis is put on the combined effects of environmentally relevant mixtures; combination of state-of-the art analytical chemistry, in vivo and in vitro systems, and 'OMICS' technologies is applied. Comparisons with the hazardous effects of other groups of pharmaceuticals will provide knowledge on the magnitude of the problem; it will generate new knowledge on environmental and health risks of cytostatics and provide objective arguments for recommendations and regulations.	http://www.nib.si/eng/index.php/aktualno/projekt/287-national-institute-of-biology-nib-is-coordinating-7-framework-programme-project-which-has-33-million-eur-budget.html - no project website yet
15	DEER, Developmental Effects of Environment on Reproduction, EU Contribution €3.5M	FP7-ENVIRONMENT Start date: 2008-05-01 End date: 2012-04-30	This research project will improve the understanding of the role of environmental factors in the development and establishment of human reproductive health. Investigation of connections between normal and abnormal foetal and perinatal reproductive development and subsequent maturation of reproductive function at puberty and in adulthood; study of systemic gene-environment interactions underlying reproductive disorders taking into account genetic susceptibility, multiple exposures (mixtures of environmental chemicals and natural products) and their timing (perinatal, peripubertal, adult); investigation of connections between perinatal reproductive development and obesity/metabolic disorders in later life.	http://www.eu-deer.net/index.htm
16	DEHALORES, Breathing chlorinated compounds: unravelling the biochemistry underpinning (de)halorespiration, an exciting bacterial metabolism with significant bioremediation potential, EU Contribution €1.15M	FP7-IDEAS Start date: 2008-09-01 End date: 2013-08-31	Seeks to unlock the full potential of bacterial metabolism for bioremediation of persistent organohalides, such as polychlorinated biphenyls (PCBs) and tetrachloroethene. However, the regulation, mechanism and structure of the reductive dehalogenase (the enzyme responsible for delivering electrons to the halogenated substrates) are poorly understood. This ambitious proposal seeks to study representatives of the distinct reductive dehalogenase classes as well as key elements of the associated regulatory systems.	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=DETAILS&DOC=1&CAT=PROJECT&QUERY=0130b2397c56:cc2a:18356864&RCN=87942 - no project website yet

17	DENAMIC, Developmental neurotoxicity assessment of mixtures in children, EU Contribution €6.99M	FP7-ENVIRONMENT Duration: 48 months	<p>Exposure to low doses of environmental biologically active contaminants during human development can alter gene expression and have deleterious effects on cognitive development in childhood. project is focused on reducing such effects of environmental contamination on learning and developmental disorders in children. It aims to study and evaluate environment-health relationships in children.</p> <p>Develop tools and methods for neurotoxic effects of mixtures of environmental pollutants at low levels, possibly resulting in (subclinical) effects on learning (cognitive skills) and developmental disorders in children; study mechanisms of disease development and the role of individual susceptibility; improve assessment of exposures and effects, focus on combined exposures to environmental agents that can interact to enhance adverse effects and reduction of health inequalities of children through Europe; dissemination will ensure the project results to arrive at policymakers' desks, and will also illustrate the subject for a scientific audience and the public. The very large network of the consortium ensures dissemination to European industries, and every other interested stakeholder.</p>	http://ec.europa.eu/research/environment/pdf/fp7_catalogue.pdf - no project website yet
18	ENFIRO, Life Cycle Assessment of Environment-Compatible Flame Retardants: Prototypical Case Study, EU Contribution €3.16M	FP7-ENVIRONMENT Start date: 2009-09-01 End date: 2012-08-31	<p>The project offers a prototypical case study on substitution options for specific brominated flame retardants (BFRs). It delivers a comprehensive dataset on viability of production and application, environmental safety, and a life cycle assessment of the alternative flame retardants (FRs).</p> <p>Collection of information on the availability of alternative FRs, their characteristics in relation to fire safety regulations, environmental behaviour, possible toxic effects, economic aspects, compatibility with polymer production and impact on the function and reliability of end products; selection of substitution options for specific BFRs for further study in a small number of case studies; technical assessment studies on application requirements regarding production properties and application functions; technical assessment on five alternative FR/product combinations: printed circuit boards, electronic components, injection-moulded products, textile back coatings and intumescent paints; determination of toxicological effects and environmental behaviour, performance of risk assessment based on all environmental and human hazard information and performance of life-cycle assessment (LCA) and a life cycle costing (LCC) analysis of the alternative FRs studied.</p>	http://www.enfiro.com/

19	ENRIECO, Environmental Health Risks in European Birth Cohorts, EU Contribution €0.91M	FP7-ENVIRONMENT Start date: 2009-03-01 End date: 2011-02-28	<p>The project will focus on exposure response relationships in environment and health in pregnancy and early childhood based and supported of the wealth of data generated by past or ongoing studies funded by the EU and national programmes.</p> <p>Inventories of birth cohorts, including health and exposure data, biological samples, environmental exposure response functions, expertise, and access; assurance of quality and interoperability and validation of exposure, health and exposure-response data; extraction and rigorous evaluation of quality of the data, including developing protocols; data access, databases and analysis, including setting-up of protocols for data access, database building and analyses, and exposure-response analyses; conduction of specific analyses on exposure and health data to obtain exposure-response functions and specific meta/pooled analyses to obtain exposure-response functions; recommendations for data collection in the future to improve environment health linkages and information for data collection (exposure, health etc), for possible analyses (laboratory and statistical) and for exchange of knowledge between (older and newer) cohorts; dissemination of information through the project website, virtual network, workshop(s), easy accessible info and a database with exposure-response functions.</p>	http://www.enrieco.org/
20	ENVIROGENOMARKER S, Genomic Biomakers of Environmental Health, EU Contribution €3.5M	FP7-ENVIRONMENT Start date: 2009-03-01 End date: 2013-02-28	<p>The project will aim at the development and application of a new generation of biomarkers to study the role of environmental agents in human disease.</p> <p>Discovery and validation of novel biomarkers predictive of increased risks of chronic diseases, in which the environment may play an important role (breast cancer, NHL, allergy, neurological and immune diseases, thyroid disruption); exploration of the association of such risk biomarkers with environmental exposures, including high-priority pollutants (carcinogens and immunotoxicants) and emerging exposures (such as phthalates and brominated flame retardants), many of which are also endocrine disrupters; discovery and validation of biomarkers of exposure to the above and other high-priority environmental exposures (e.g., water disinfection by-products).</p>	http://www.envirogenomarkers.net/
21	EXPLOIT-CSIA, Exploiting the potential use of compound specific isotope analysis (CSIA) in marine environment, EU Contribution €240,000	FP7-PEOPLE Start date: 2010-09-01 End date: 2012-08-31	To explore, develop and exploit the potential use of Compound Specific Isotope Analysis (CSIA) to PAHs and POPs compound groups in marine environments in order to unambiguously allocate and distinguish their contaminant sources, track their contamination pathways (environmental forensics), identify and quantify transformation reactions, chemical or biological remediation processes as well as degradation mechanisms	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b71262d3:c74c:56e3be5f&RCN=96372 - no project website yet

22	FACET, Flavourings, Additives and food Contact materials Exposure Task, EU Contribution €5.88M	FP7-KBBE Start date: 2008-09-01 End date: 2012-08-31	The project will estimate exposure to flavours, additives and food contact materials across Europe and the creation of a food chemical exposure surveillance system. Recording the occurrence levels of targeted chemicals in representative regions of the EU food supply. This will include a major survey of food packaging usage in countries representative of the regional groupings of FACET; creation of a database of targeted food chemical concentrations in foods, working closely with the food and packaging sectors, and the regulatory authorities; establishment of a migration modelling framework for complex packaging materials into foods under real conditions of use to deliver realistic concentration estimates for consumer exposure modelling; construction of a tiered food intake database aimed at foods, which are relevant to the target food chemicals; development of a personal computer-based, publicly available software programme, taking in to account the variation of national food consumption data, which will draw on limited data, build on known laws governing food intake and in particular build on small national surveys and local knowledge to model regional intake of target foods; building of new databases, populate them with the data generated by the project and to estimate exposure assessment using a probabilistic model.	http://www.ucd.ie/facet/
23	FOODSEG, Safe food for Europe – Coordination of research activities and dissemination of research results of EU funded research on food safety, EU Contribution €1M	FP7-KBBE Start date: 2011-05-01 End date: 2014-04-30	The project will disseminate state-of-the-art research results in food safety and quality topics through a series of symposia, expert working group meetings, an online platform with best practise examples and coordination of cooperation and a plan for the preparation of future activities.	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b6fc6aa8:2f48:57083f56&RCN=98810 - no project website yet
24	HEROIC, Health and environmental risks: organisation, integration and cross-fertilisation of scientific knowledge, EU Contribution €0.98M	FP7-ENVIRONMENT Duration: 36 months	Due to the lack of mutual understanding between experts of individual disciplines, data from toxicological and ecotoxicological studies is not readily accessible by risk assessors across disciplines. However, the need for risk assessment (RA) will continue to along with budget restrictions and political and public pressure to reduce the number of animal tests. More cost effective, predictive and rapid tests for high quality sustainable RA are needed including a better exploitation of existing data. Better risk communication to regain consumer/public trust and to give unambiguous guidance for improved risk management. Divergence often arises on risk policies and measures, sometimes due to different RA approaches. The project will establish and co-ordinate a global network of European and international experts and stakeholders from different disciplines to establish stronger interfaces between human and environmental RA, between RA and risk management, between the various agencies and countries within the EU and between agencies and industry.	http://ec.europa.eu/research/environment/pdf/fp7_catalogue.pdf - no project website yet

25	INTERNAL EXPOSURE, Internal exposure in tissue equilibrium sampling to bridge the missing link between bioavailability and bioaccumulation, EU Contribution €180,000	FP7-PEOPLE Start date: 2008-04-15 End date: 2011-10-14	The overall goal of this application is to improve the understanding of the link between concentrations of organic contaminants in the marine environment and the contaminant levels in the tissues of higher organisms where adverse effects are occurring, analysing internal exposure, bioaccumulation and bioavailability of organic contaminants. Investigation in the missing link between external concentrations of POPs and their levels at target sites in organisms where adverse effects occur.	http://www.itm.su.se/page.php?pid=492
26	MARPAH, Marine micro-algae as global reservoir of polycyclic aromatic hydrocarbon degraders, EU Contribution €330,000	FP7-PEOPLE Start date: 2008-10-20 End date: 2011-10-19	To manage and mitigate the impacts of PAH pollution in the marine environment, it is necessary that we understand the mechanisms involved in their biodegradation.	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJECT&QUERY=0130b236edee:17bb:77108fab&RCN=88345 - no project website yet
27	OBELIX, Obesogenic Endocrine disrupting chemicals: Linking prenatal exposure to the development of obesity later in life, EU Contribution €3M	FP7-KBBE Start date: 2009-05-01 End date: 2013-04-30	It will investigate if prenatal exposure to endocrine disrupting compounds in food plays a role in the development of obesity and related disorders later in life. Assessment of prenatal exposure in humans to major classes of EDCs in food identified as potential inducers of obesity and related disorders later in life, using mother-child cohorts from various European regions with different food contaminant exposure patterns; Relating markers for early life exposure to EDCs with effect biomarkers, novel biomarkers and health outcome data, which are related to risk for obesity and related disorders later in life; Performing hazard characterization of in utero exposure to representatives of major classes of EDCs in food with respect to the development of obesity later in life, using dose-response analysis in a rodent (mouse) model; Determination of mechanisms of action of obesogenic EDCs using analysis of effect biomarkers, gene expression and epigenetic analysis. Mouse models, in vitro models and analysis in peripheral mononuclear cells of biological samples from the cohorts, will be used as complementary tools; Performing risk assessment of prenatal exposure to obesogenic EDCs in food, by integrating maternal exposure through food, contaminant exposure and health effect data in children, and hazard characterization and mechanistic information in animal and in in-vitro studies.	http://www.theobelixproject.org/

28	OPENTOX, An open source predictive toxicology framework, EU Contribution €2.97M	FP7-HEALTH Start date: 2009-07-01 End date: 2014-06-30	<p>The project will create a unified access framework to toxicological data, quantitative models and supporting information and it will provide tools for the integration of data from various sources. Development of a framework providing a unified access to toxicity data, (Q)SAR models, procedures supporting validation and additional information that helps with the interpretation of (Q)SAR predictions;</p> <p>Provision of accessibility at three levels: (i) A simple and intuitive interface for toxicological experts that provides unified access to (Q)SAR predictions, toxicological data, (Q)SAR models and supporting information; (ii) An expert interface for the streamlined development and validation of new (Q)SAR models; (iii) An application programming interface for the development, integration and validation of new (Q)SAR algorithms;</p> <p>Development as an open source project to optimise the dissemination and impact, to allow the inspection and review of algorithms and to attract external contributors;</p> <p>Close collaboration with related projects (e.g., OECD QSAR toolbox) and relevant authorities to agree on common standards and to avoid duplicated and redundant work.</p>	http://www.opentox.org/
29	OUTREACH, Overlooked Unresolved Toxic Organic Pollutants: Resolution, Identification, Measurement and Toxicity, EU Contribution €2M	FP7-IDEAS Start date: 2009-07-01 End date: 2014-06-30	Identification, measurement and study of the effects of unresolved and unidentified, complex mixtures (UCMs) of organic chemicals	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=13&CAT=PROJ&QUERY=0130b2290de1:7015:28acdc28&RCN=91068 - no project website yet
30	PERFOOD, Perflourinated organic in our diet, EU Contribution €3M	FP7-KBBE Start date: 2009-08-01 End date: 2012-07-31	<p>The project focuses on the development of robust and reliable analytical tools, including reference materials for the determination of PFCs in food items. The aim is to qualify and quantify PFCs in our diet, understand how PFCs are transferred from the environment into dietary items, and quantify the possible contribution of food/beverage contact materials and food and water processing to the overall PFC levels in our diet.</p> <p>Assessment of the origin of PFCs in our diet and the contribution of the diet to the total human exposure to PFCs; development of robust and reliable analytical tools for the determination of PFCs, and using of these to (i) qualify and quantify PFCs in our diet; (ii) understand how PFCs are transferred from the environment into dietary items, and (iii) quantify the possible contribution of food/beverage contact materials and food and water processing to the overall PFC levels in our diet; evaluation of the possible routes, including their relative importance, of human exposure to PFCs via our diet; assessment of the role of the technosphere in the contamination of our food; identification of ways to reduce the PFC contamination of dietary articles.</p>	http://www.perfood.eu/

31	PHARMAS, Ecological and human health risk assessments of antibiotics and anti-cancer drugs found in the environment, EU Contribution €2.8M	FP7-ENVIRONMENT Start date: 2011-01-01 End date: 2013-12-31	Assess the risks to wild animals and humans posed by environmental exposure to pharmaceuticals. This project will concentrate on two classes of human pharmaceuticals, namely antibiotics and anti-cancer drugs, considering uncertainty to obtain accurate data on both exposure concentrations and effects levels.	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=DOCUMENT&DOC=7&CAT=PROJECT&QUERY=012d5027c1d5:b8ab:4d39d878&RCN=97551 - no project website yet
32	QSAFFE, Quality and safety of feeds and food for Europe, EU Contribution €2.99M	FP7-KBBE Start date: 2011-03-01 End date: 2014-08-31	The project will deliver better, faster and economically viable means of ensuring the quality and safety of animal feeds in Europe. Provide an integrated approach to the reduction and management of chemical and microbiological contamination in animal feeds, better ways of preventing contamination and fraud, identifying and assessing new risks and providing scientific evidence of the risks of transfer of microbiological and chemical contaminants from feed to food. Development of new strategies for quality and safety assurance in the feed chain using existing testing methods and emerging technologies; development and improvement of systems of traceability and authenticity monitoring of the major feed materials used in Europe; identify the emerging risks (chemical and microbiological) from new sources of animal feed materials that may arise from changes to the formulation/composition of animal feeds and due to economic factors; undertake optimization and application of pharmaco-kinetic models focussing on a number of carefully selected transfer problems such as dioxins and PCBs, melamine and related compounds, Salmonella spp. and Listeria monocytogenes based on existing data and data generated in the studies performed within the project.	http://www.qsaffe.eu/
33	REEF, Reproductive effects of environmental chemicals in females, EU Contribution €2,92M	FP7-ENVIRONMENT Start date: 2008-05-01 End date: 2011-04-30	The project will use a pattern of gestational development similar to humans, exposed long-term to a broad range of environmental chemicals (ECs) at low/environmental concentrations. This will provide a real-life model for human exposure. Examination of the effects of sewage sludge exposure during specific periods of foetal ovarian development in the sheep; examination of the effects of environmental concentrations of bis(2-ethylhexyl)phthalate (DEHP) and polychlorinated biphenyls (PCBs) on female reproductive development in the sheep and mouse; investigation of the transgenerational effects of DEHP and PCB exposure on F2 sheep and mouse ovaries; examination of the effects of DEHP and PCBs on cultured human and sheep foetal ovaries; integration of human and animal models.	http://www.abdn.ac.uk/reef/

34	SYSTEQ, The development, validation and implementation of human systemic Toxic Equivalencies (TEQs) as biomarkers for dioxin-like compounds, EU Contribution €2.7M	FP7-ENVIRONMENT Start date: 2009-02-01 End date: 2013-01-31	TEQs are developed as biomarkers for exposure and risk of dioxin-like compounds, since chlorinated dioxins and biphenyls (PCBs) commonly occur in the human food chain and can still be detected at levels that might cause long term health effects. Establishment of possible differences between 'uptake' and 'systemic' TEFs; study of novel quantifiable biomarkers in in-vitro experiments; exploration of the possibility to use effects in peripheral lymphocytes as novel biomarkers; study of differences in TEFs between humans and experimental animal species in in-vitro experiments; testing of polychlorinated dibenzodioxins (PCDDs), polychlorinated dibenzofurans (PCDFs) and polychlorinated biphenyls (PCBs) in different in vitro systems; comparison of systemic TEFs (rodent models) and in vitro TEFs (rodent and human models) by applying multivariate statistical techniques; contribution to risk assessment; validation of biomarkers; contribution to establishing international consensus values of human 'systemic' TEF values for dioxin-like compounds, including some highly toxic PCBs.	http://www.systeqproject.eu/
35	TATOO, Tagging Tool based on a Semantic Discovery Framework, EU Contribution €2.52M	FP7-ICT Start date: 2010-01-01 End date: 2012-12-31	To set up a semantic web solution to close the discovery gap that prevents a full and easy access to environmental resources on the web. The Central and Eastern European Centre for Persistent Organic Pollutants will participate in the project of validation.	http://www.tatoo-fp7.eu/tatooweb/
36	TMP53COMPPIX, Transcriptional mutagenesis in mammalian cell systems: p53 signaling as a probe of cellular effects, EU Contribution €100,000	FP7-PEOPLE Start date: 2010-05-01 End date: 2014-04-30	The model is based on the central role of p53 in the cellular response to DNA damages derived from carcinogenic polycyclic aromatic hydrocarbons (PAHs).	http://cordis.europa.eu/fetch?CALLER=FP7_PROJ_EN&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b238120e:ba93:06e913f6&RCN=94459 - no project website yet
37	TRANSPHORM, Transport related Air Pollution and Health impacts - Integrated Methodologies for Assessing Particulate Matter, EU Contribution €6.91M	FP7-ENVIRONMENT Start date: 2010-03-01 End date: 2014-02-28	The project will develop and implement an integrated methodology to assess the health impacts of particulate matter (PM) resulting from transport related air pollution. Quantification of pollutant-specific human exposure to airborne particulate matter in urban environments resulting from emissions from the main transport sectors; conduction of measurement campaigns in Rotterdam, Helsinki and Thessaloniki for source apportionment, exposure assessment and model evaluation purposes establishing new and unique datasets to better reflect actual exposure to air pollution caused by the transport sector; development, improvement and integration of air quality dispersion and exposure models for urban and regional scales; determination of improved and, where necessary, new emission factors of ultrafine particle number expressed as PN0.1 and mass fractions of PM1, PM2.5 and PM10 for key transport sources; development of an integrated assessment methodology to connect the various transport sources to human exposure to air pollution; development of new concentration-response or exposure-response functions linking long and short-term ambient residential exposure to size-resolved and speciated PM with key health endpoints; application of the full chain integrated health assessment method to a number of selected European cities experiencing pollution from road traffic, harbours and shipping, airports and other sources such as railways.	http://www.transphorm.eu/

14	PIONEER, Puberty onset – influence of nutritional, environmental and endogenous regulators, EU Contribution €3M	FP6-FOOD Start date: 2005-03-01 End date: 2008-02-29	The project will help to identify genetic subpopulations that may be at high risk for early sexual maturation and develop novel experimental test models, needed for the development of preventive strategies and will study the multifaceted interactions between genetic and nutritional factors that may influence sexual maturation. Obtain updated scientific data on the age of puberty onset in the different regions of Europe; identify some genetic and nutritional factors involved in the regulation of the onset of puberty, with special reference to their interactions; develop novel experimental test models, including in vivo animal models, optimized for the investigation of genetic and nutritional factors regulating onset of puberty; define if specific actions are necessary within EU, to avoid children from maturing too early sexually. An understanding role of nutritional factors, it is of paramount importance to know, which individuals have the genetic susceptibility to environmental factors, which may cause early maturation.	http://cascade.projectcoordinator.net/~pioneer
15	REP-LECOTOX, Reinforcement of research potential of laboratory for ecotoxicology, EU Contribution €290,000	FP6-INCO Start date: 2007-01-01 End date: 2009-12-31	Research focused on toxic impact of persistent organic pollutants on biota with special emphases on fresh water ecosystem The research activities are identification and characterization of aquatic ecotoxicity.	http://cordis.europa.eu/fetch?CALLER=FP6_PROJ&ACTION=D&DOC=1&CAT=PROJ&QUERY=0130b2852405:0c35:42addb19&RCN=90042

Table 10 Research Projects with references to POPs funded by LIFE+

No.	Acronym, Title, EU contribution	Programme, Duration time	Project reference, Objectives or Main results	More information
1	WOMENBIOPOP, Linking Environment and Health: a Country-based Human Biomonitoring Study on Persistent Organic Pollutants in Women of Reproductive Age, €0,8M	Start date: 2010-04-01 End date: 2010-10-01	LIFE08/ENV/IT/000423, To respond to the increasing demand for information on the level of exposure to POPs of environmental origin. It will focus on the subpopulation of women of reproductive age (20-40 years), whose exposure to POPs will be assessed through biomonitoring.	http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=search.dspPage&n_proj_id=3433
2	EXPAH, Population Exposure to PAH, €2M	Start date: 2010-10-01 End date: 2013-12-31	LIFE09 ENV/IT/000082, To address the environmental and health problems caused by the emission, dispersion and transformation of PAH compounds.	http://ec.europa.eu/environment/life/project/Projects/index.cfm?fuseaction=search.dspPage&n_proj_id=3756
